International Workshop  
on the Application of Carbon-neutral Fuel

September 9, 2021

# ReFuel 2021 International Workshop on the Application of Carbon-neutral Fuel

Organized by

Supported by

Thomas Koch,  
Choongsik Bae (eds.)  
and 5 authors

# Preface

Dear colleagues,

It was great for us to host ReFuel 2021 as an on-line workshop. We are pleased to bind and distribute the presentations by six world-renowned specialists who volunteered to contribute the active discussion on carbon-neutral future transportation. This workshop subject on carbon-neutral fuel was motivated by the position paper issued by IASTEC. This workshop enlightened scientific, reasonable, and balanced view points.

We believe the workshop provided the window for the global opinion exchange and ignited further discussions on the optimal passage to carbon neutrality. This workshop attracted more than 250 participants from 17 countries.

We appreciate contributors and hope the proceedings to be an useful literature.

We wish you all the best and health.

## Organization Committee

Prof. Dr. sc. techn. Thomas Koch (General chair)

Prof. Dr. Choongsik Bae (Program chair)

# ReFuel 2021

**International Workshop on the Application of Carbon-neutral Fuel**  
**September 9, 2021 · Free registration · Online meeting (Zoom)**

ReFuel2021 will bring together academics, research, and industrial experts in the field of energy and environment mainly in the field of fuel processing and transportation.

This workshop aims to promote scientific information exchange and discussions between researchers, developers, and practitioners to achieve reasonable carbon-neutral energy supply chain for transportation with well-balanced view and analyses.

## Committees

General Chair	Prof. Thomas Koch, Karlsruhe Institute of Technology (KIT), Germany
Program Chair	Prof. Choongsik Bae, Korea Advanced Inst. of Science and Tech. (KAIST), Korea

## Program

### Session chair: Amin Velji (KIT)

09:00 (CEST)  
16:00 (FET)      Opening remark      Choongsik Bae (KAIST)

09:10      Perspectives of ReFuel      Thomas Koch  
(KIT, Germany)

09:35      Statistics and Physics of the Transition of Energy  
and Mobility Systems in Europe      Frank Atzler  
(TU Dresden, Germany)

### Session chair: Olaf Toedter (KIT)

10:10      Japanese policy for carbon neutrality and e-fuel      Akiteru Maruta  
(Technova Inc., Japan)

10:35      E-fuel contribution via R&D in Finland      Martti Larmi  
(Aalto Univ., Finland)

11:00      An Efficient Way of e-fuel Production      Seok Ki Kim  
(KRICT: Korea Research Inst. of  
Chemical Tech.)

### Session chair: Choongsik Bae (KAIST)

11:25      Mobile Carbon Capture (MCC)      Esam Hamad  
(Saudi Aramco, Saudi Arabia)

11: 50      Panel Discussion

12:10 (CEST)  
19:10 (FET)      Closing remark      Thomas Koch (KIT)

## Overview

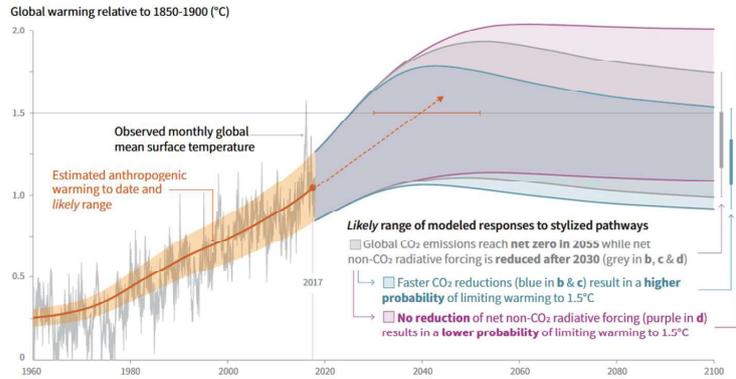

- 1 IPCC Guideline
- 2 Why reFuels?
- 3 Why IASTEC?
- 4 Critical discussion?
- 5 Summary

# 2018: IPCC report „Global warming of 1.5°C “

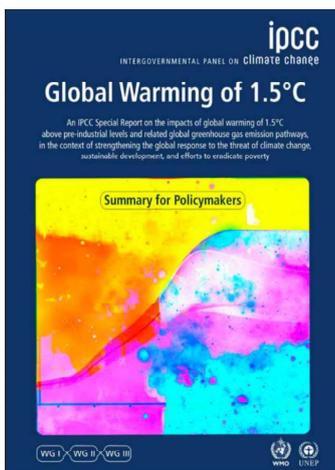

[https://www.ipcc.ch/site/assets/uploads/sites/2/2019/05/SR15\\_SPM\\_version\\_report\\_LR.pdf](https://www.ipcc.ch/site/assets/uploads/sites/2/2019/05/SR15_SPM_version_report_LR.pdf)

A.1 Human activities are estimated to have caused approximately 1.0°C of global warming<sup>9</sup> above pre-industrial levels, with a *likely* range of 0.8°C to 1.2°C. Global warming is *likely* to reach 1.5°C between 2030 and 2052 if it continues to increase at the current rate. (*high confidence*) (Figure SPM.1) (1.2)

**Summary of A.1: Between 2030 and 2052, global warming will reach 1.5°C if it continues to increase at the current rate!**

# 2018: Total CO<sub>2</sub> budget

[https://www.ipcc.ch/site/assets/uploads/sites/2/2019/05/SR15\\_SPM\\_version\\_report\\_LR.pdf](https://www.ipcc.ch/site/assets/uploads/sites/2/2019/05/SR15_SPM_version_report_LR.pdf)

C.1.3 Limiting global warming requires limiting the total cumulative global anthropogenic emissions of CO<sub>2</sub> since the pre-industrial period, that is, staying within a total carbon budget (*high confidence*).<sup>13</sup> By the end of 2017, anthropogenic CO<sub>2</sub> emissions since the pre-industrial period are estimated to have reduced the total carbon budget for 1.5°C by approximately 2200 ± 320 GtCO<sub>2</sub> (*medium confidence*). The associated remaining budget is being depleted by current emissions of 42 ± 3 GtCO<sub>2</sub> per year (*high confidence*). The choice of the measure of global temperature affects the estimated remaining carbon budget. Using global mean surface air temperature, as in AR5, gives an estimate of the remaining carbon budget of 580 GtCO<sub>2</sub> for a 50% probability of limiting warming to 1.5°C, and 420 GtCO<sub>2</sub> for a 66% probability (*medium confidence*).<sup>14</sup> Alternatively, using GMST gives estimates of 770 and 570 GtCO<sub>2</sub>, for 50% and 66% probabilities,<sup>15</sup> respectively (*medium confidence*). Uncertainties in the size of these estimated remaining carbon budgets are substantial and depend on several factors. Uncertainties in the climate response to CO<sub>2</sub>, and non-CO<sub>2</sub> emissions contribute ±400 GtCO<sub>2</sub>, and the level of historic warming contributes ±250 GtCO<sub>2</sub> (*medium confidence*). Potential additional carbon release from future permafrost thawing and methane release from wetlands would reduce budgets by up to 100 GtCO<sub>2</sub>, over the course of this century and more thereafter (*medium confidence*). In addition, the level of non-CO<sub>2</sub> mitigation in the future could alter the remaining carbon budget by 250 GtCO<sub>2</sub>, in either direction (*medium confidence*). (1.2.4, 2.2.2, 2.6.1, Table 2.2, Chapter 2 Supplementary Material)

**Summary of C.1.3: Limiting total cumulative global anthropogenic CO<sub>2</sub> emissions is essential to limiting global warming. A budget of 420 Gt CO<sub>2</sub> has a 66% probability of limiting 1.5°C warming.**

# 11.12.2019: EU Green Deal

Quelle: <http://www.gesetze-im-internet.de/ksjg/BJNR251310019.html>

**A key message of the EU Green Deal: by summer 2020, the Commission will present a plan to raise the greenhouse gas emissions reduction target to at least 50% by 2030 and a target of 55% compared to 1990.**

# 17.12.2019: Federal Law of the BMU

Quelle: <https://eur-lex.europa.eu>

2520 Bundesgesetzblatt Jahrgang 2019 Teil I Nr. 48, ausgegeben zu Bonn am 17. Dezember 2019

## Anlage 2 (zu § 4)

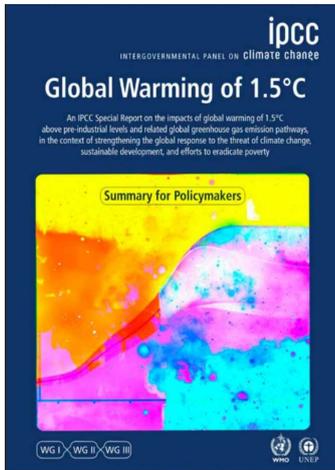

Zulässige Jahresemissionsmengen

Jahresemissionsmenge in Mio. Tonnen CO <sub>2</sub> -Äquivalent	2020	2021	2022	2023	2024	2025	2026	2027	2028	2029	2030
Energiewirtschaft	280		257								175
Industrie	186	182	177	172	168	163	158	154	149	145	140
Gebäude	118	113	108	103	99	94	89	84	80	75	70
Verkehr	150	145	139	134	128	123	117	112	106	101	95
Landwirtschaft	70	68	67	66	65	64	63	61	60	59	58
Abfallwirtschaft und Sonstiges	9	9	8	8	7	7	7	6	6	5	5

**Implementation in the form of the Federal Climate Protection Act envisions a reduction in CO<sub>2</sub> equivalent emissions from the transportation sector of approximately 37% in 2030 compared to 2020.**

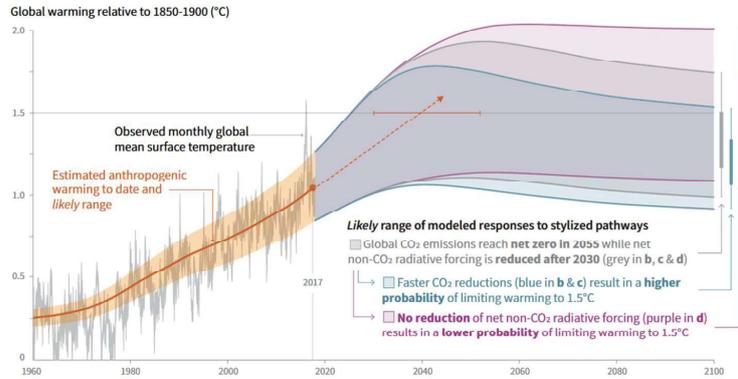

# 2018: IPCC report „Global warming of 1.5°C “

[https://www.ipcc.ch/site/assets/uploads/sites/2/2019/05/SR15\\_SPM\\_version\\_report\\_LR.pdf](https://www.ipcc.ch/site/assets/uploads/sites/2/2019/05/SR15_SPM_version_report_LR.pdf)

A.1 Human activities are estimated to have caused approximately 1.0°C of global warming<sup>a</sup> above pre-industrial levels, with a *likely* range of 0.8°C to 1.2°C. Global warming is *likely* to reach 1.5°C between 2030 and 2052 if it continues to increase at the current rate. (*high confidence*) (Figure SPM.1) (1.2)

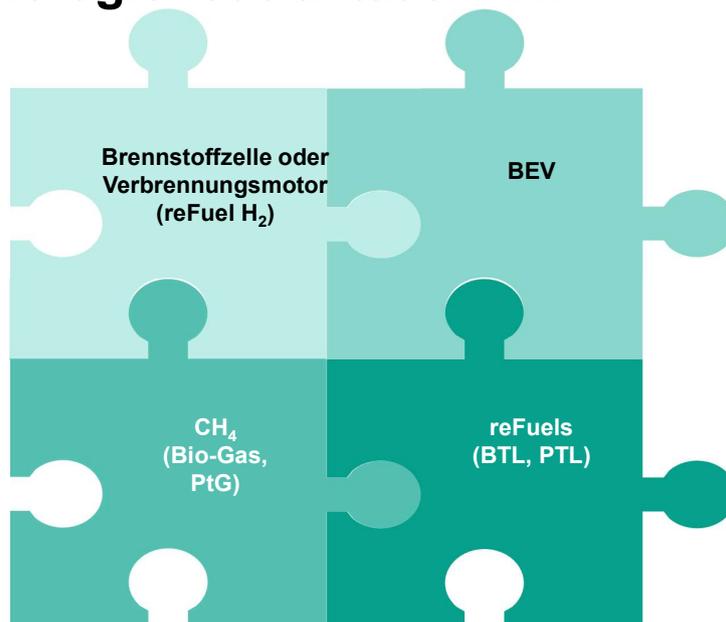

## Summary of IPCC: A remaining CO<sub>2</sub>-budget of 420 Gt CO<sub>2</sub> has a 66% probability of limiting 1.5°C warming.

# 2016: Renewable energy directive

- 5 Summary

## Technologieneutralität am KIT

reFuels  =  
bioFuels + eFuels

We at KIT believe in a multidimensional solution of the future, where different technology solutions co-exist.

# Project reFuels

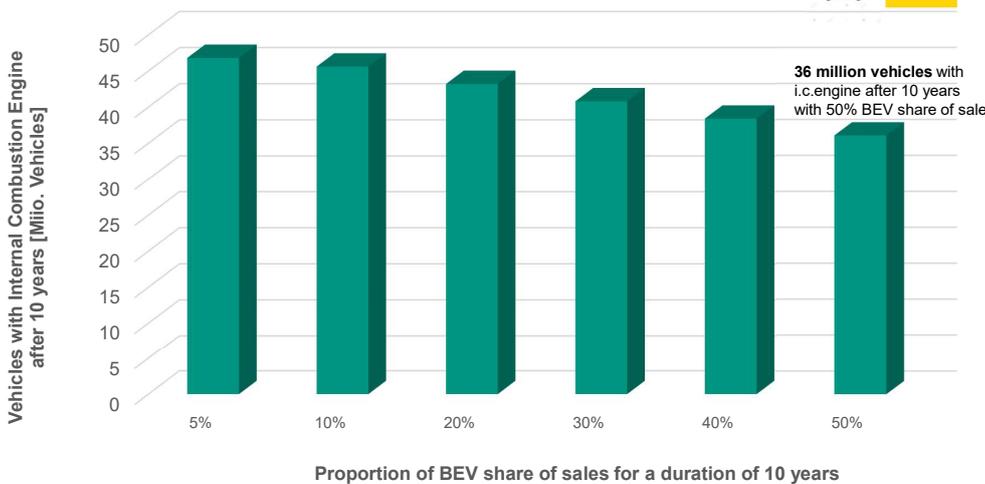

## Additional Information

- Industry partners and Baden-Württemberg invested 20. Mio € into refuels project.
- Ministry of transport of Baden-Württemberg is initiating political partner of refuels project.
- Project start was 1/2019.
- The first phase ends in 2021.
- More than 20 industry partners are involved with an unique contribution by automobile as well as mineral oil industry

The reFuels project is combining basic academic research questions with major environmental, industry as well as society issues.

## Why reFuels project?

## Boundary conditions and analysis

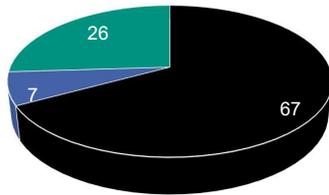

- The KBA Data from 2009 to 2019 act as reference for the next decade.
- PHEV as well as HEV are also vehicles with internal combustion engine.
- Even with a 50% BEV share of sales in Germany, there would be more than one million new vehicles per year with internal combustion engine.
- BEV are a part of the solution, but not the only solution.

It is completely independent from political decisions and market response: most of total fleet vehicles will have an internal combustion engine in the year 2030.

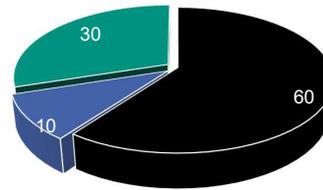

# reFuels recommendation for 2030

Diesel Fuel R33 according to today's specification (EN590)

■ foss. Diesel ■ FAME ■ paraff. Diesel

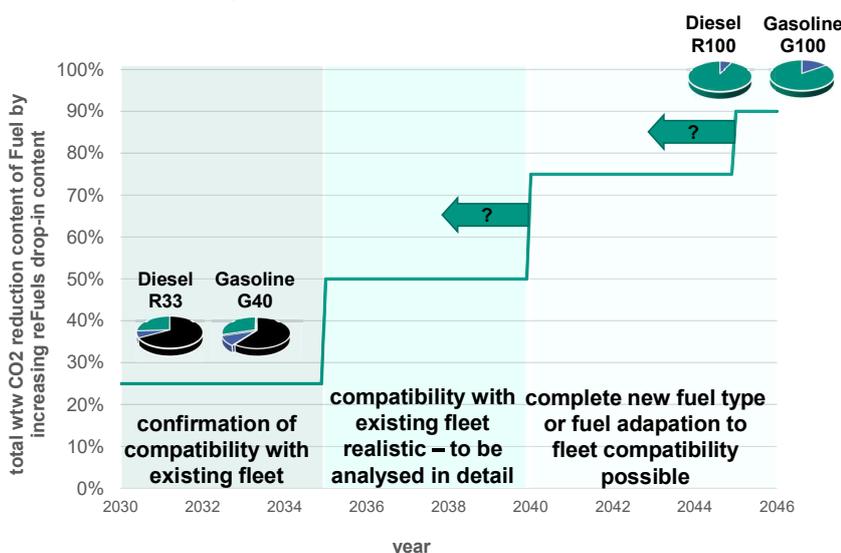

Gasoline Fuel G40 according to today's specification (EN228)

■ foss. Super ■ Ethanol ■ MtG Benzin

**A fuel CO<sub>2</sub>-reduction potential of 25% can be realized within today's fleet compatible fuel specification. MTG or paraffinic diesel refuel can be produced via different routes (bioFuel, eFuel).**

# reFuels beyond 2030

## Information

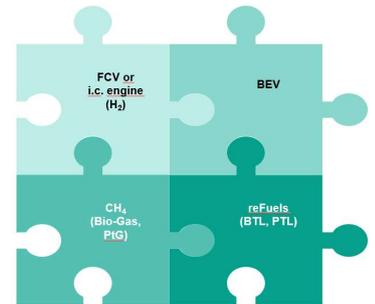

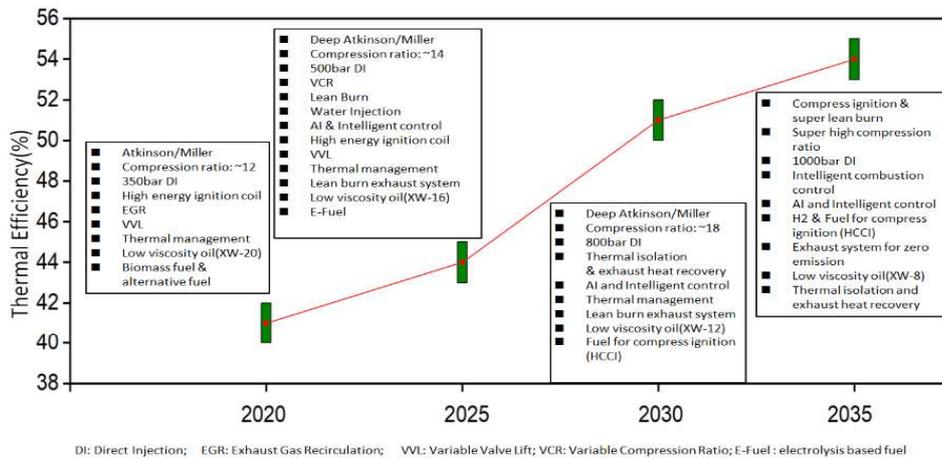

- Compatibility of Gasoline reFuel seems to be more challenging than diesel to enable fleet compatibility according to EN228/EN590.
- However, a compatibility with EN228/EN590 up to 50% CO<sub>2</sub> reduction potential by increased reFuels blending rate is realistic.
- A mid-term >90% CO<sub>2</sub>-reduction by fuels within the next 25 years together with additional technology development enables a reduction of CO<sub>2</sub>-footprint of traffic sector by >95%.**

**Even today's technology can be compatible with 100% refuel content. A mid-term 100% fleet compatible substitution of fossil fuels by reFuels is necessary. A step-by-step increase of the drop-in rate is recommended.**

Information

- China has published a long term strategy with internal combustion engine technology.
- There is not only one solution for the future:

China is following the refuels path.

# WKM: German scientific association: first and second position paper

**WKM**  
Wissenschaftliche Gesellschaft für Kraftfahrzeug- und Motorentechnik e.V. (WKM)

Die WKM e.V. ist die Vereinigung von Professoren deutscher, österreichischer und schweizerischer Universitäten, die als Institutsleiter oder als Leiter von Fachgebieten oder Lehrstühlen auf dem Gebiet der Kraftfahrzeug- und Motorentechnik tätig sind oder waren.

Zweck der WKM ist die Förderung von Wissenschaft und Forschung, von wissenschaftlicher Lehre, Studium und Heranbildung des wissenschaftlichen Nachwuchses auf dem Gebiet der Kraftfahrzeug- und Motorentechnik.

Nach intensiven Diskussionen insbesondere über dieselmotorische Emissionsfestlegungen und einer Beratung dieser Sachverhalte im Jahr 2017 hat die WKM e.V. dieses zweite Positionspapier im Rahmen der aktuellen Bestrebungen zur Erarbeitung einer neuen „CO<sub>2</sub>-Gesetzgebung im Verkehrssektor“ ausgearbeitet.

**Drittes WKM Positionspapier**  
März 2021

Technische, regulatorische und gesellschaftliche Herausforderungen bei der Realisierung einer CO<sub>2</sub>-neutralen Antriebstechnik für PKW und Nutzfahrzeuge in den nächsten Jahrzehnten

**WKM**  
Wissenschaftliche Gesellschaft für Kraftfahrzeug- und Motorentechnik e.V.

## Key messages:

### We hardly save CO<sub>2</sub> with BEV transfer within the next decade!

5. Mit dem aktuellen deutschen Bundesklimaschutzgesetz wird das Reduzierungspotenzial nicht ausgeschöpft. Die Empfehlungen des IPCC (intergovernmental panel of climate change) nach einer raschen CO<sub>2</sub>-Emissionsreduzierung werden nicht bestmöglich umgesetzt, und eine unnötige Belastung des CO<sub>2</sub>-Restbudgets ist die Folge [12-15].
2. Die Frage der ganzjährigen Bereitstellung CO<sub>2</sub>-schonender elektrischer Energie verbleibt über Jahrzehnte eine große Herausforderung.
  - a. Daher wird die Umstellung auf batterieelektrische Fahrzeuge im PKW-Markt frühestens 2035 einen entscheidenden Anteil an der CO<sub>2</sub>-Emissionsreduzierung tragen [13].
3. Die WKM kritisiert allerdings, dass durch die derzeit getrennte Betrachtung der Sektoren keine ganzheitlich optimale Absenkung der CO<sub>2</sub>-Emissionen erreicht wird [26]. Vielmehr führt die Regulierung zu einer singulären Optimierung der einzelnen Sektoremissionen. Dadurch werden große ganzheitliche CO<sub>2</sub>-Potentiale nicht genutzt, falsche Stoppsignale für die Technologieentwicklung gesetzt und wichtige Technologien nicht betrachtet. So ist auf der Basis der geplanten Regulierung zukünftig nur das batterieunterstützte (BEV/PHEV) oder das H<sub>2</sub>-getriebene Fahrzeug (FCV, VM) ohne CO<sub>2</sub>-Strafzahlungen verkäuflich, obwohl mit reFuels betriebene Fahrzeuge vergleichbare Umweltvorteile aufweisen [27].

#### Summary

The substitution of energy based on fossil fuels in different sectors like household or traffic by electric energy saves CO<sub>2</sub> of this specific sector due to decreased fossil fuel consumption. An important quantity is the additional CO<sub>2</sub> emission  $\Delta F(\bar{D}, \Delta D)$  due to an increased electric power demand  $\Delta D$  for the average electricity power demand  $\bar{D}$ . Commonly, the formula  $\Delta F(\bar{D}, \Delta D) \approx M(\bar{D})\Delta D$  is used (called simplified formula, where  $M(\bar{D})$  represents mean average CO<sub>2</sub> footprint). It is shown in the present manuscript, that the simplified formula may underestimate the CO<sub>2</sub> footprint significantly if the average CO<sub>2</sub> footprint depends on the average electricity power demand, which is the case for most of mixed partly renewable and partly non-renewable electric energy systems. Therefore, the real CO<sub>2</sub> emissions would outreach those according to simplified formula by factor 2 in reality depending on the status of the electricity system. In order to establish a more precise calculation of the CO<sub>2</sub> footprint, the general formula  $\Delta F(\bar{D}, \Delta D) = \bar{D}\Delta M(\bar{D}, \Delta D) + \Delta D M(\bar{D} + \Delta D)$  which is exact and contains the simplified formula as a special case, is derived in this manuscript. The simplified formula requires an additional term that takes into account the change of the mean average CO<sub>2</sub> footprint  $\Delta M$  depending on the electricity power demand.

#### KEYWORDS

CO<sub>2</sub> emissions, electricity, fossil-based energy, non-fossil-based energy, fundamental theorem of differential and integral calculation according to Leibniz

Thomas Koch, Thomas Böhlke

Based on  $f_x = u(x) \cdot \Delta f = u(x) \Delta x$  and  $M(x) = f_x / \Delta x$ , this result may be decomposed into

$$\Delta F(x, \Delta x) = M(x) \Delta x + \frac{f_x}{2} \Delta x + \frac{\Delta f}{2} \Delta x \quad (48)$$

With this example in mind it becomes clear, that the average  $M(x)$  multiplied by  $\Delta x$  as an estimator for  $\Delta F(x, \Delta x)$ , i.e.,  $\Delta F(x, \Delta x) \approx M(x) \Delta x$ , produces an erroneous result, because the terms  $f_x \Delta x / 2$  and  $\Delta f \Delta x / 2$  have been neglected.

## 4 | DISCUSSION AND CONCLUSION

For the calculation of CO<sub>2</sub> emissions of additional electric energy demand, insufficient simplified mathematic models are typically used, which might be motivated by the complexity of the electricity supply sources and the grid situation. An example for such a simplified formula to analyze the additional CO<sub>2</sub> emissions per time interval  $\Delta F(\bar{D}, \Delta D)$  caused by additional electric power  $\Delta D$  (unit: Watt) is the direct utilization of the average CO<sub>2</sub> emission footprint  $M(\bar{D})$  (unit:  $\text{kg}_{\text{CO}_2}/\text{kWh}$ ) for a given average electricity demand  $\bar{D}$  of the electricity sector by the equation

$$\Delta F(\bar{D}, \Delta D) = M(\bar{D})\Delta D, \quad (49)$$

which corresponds to the simplified formula introduced in section 3, (see equation (25)). As shown in section 3, the following integral would be the exact formulation

$$\Delta F(\bar{D}, \Delta D) = \int_{\bar{D}}^{\bar{D}+\Delta D} f(D) dD. \quad (50)$$

Here,  $f(D)$  represents the specific CO<sub>2</sub> emissions as a function of electric power demand  $D$ .

The mathematical analysis showed, that equation (49) is only valid, when the CO<sub>2</sub> emissions are completely independent from the energy supply situation, i.e., if the complete electric energy would be either supplied constantly only by one technology, i.e., wind power, or would be supplied by a constant mix of several technologies, i.e. a combination of wind power and photovoltaics power, which is both by far not the case.

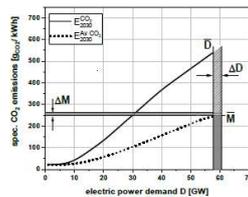

FIGURE 6 Graphical illustration of equation (49) and (50). Please note that the depicted areas represent  $M(\bar{D})\Delta D$  and  $\Delta F(\bar{D}, \Delta D)$ .

## 1 | GENERAL INTRODUCTION

The rapid reduction of global CO<sub>2</sub> emissions is the key recommendation of the Intergovernmental Panel of Climate Change (IPCC). Policy makers around the world are responding to this ambitious target (1). A total global remaining CO<sub>2</sub> budget of 420 Gt for all humanity was analyzed by the IPCC to limit global warming to 1.5 °C. Detailed prohibitions for the achievement of the warming limit have been determined but are unimportant for the focus of this publication.

A policy approach to manage and analyze the reduction of CO<sub>2</sub> emissions is to define different sectors such as electric power, transport, industry, households. Each sector is typically regulated with a tighter limit on CO<sub>2</sub> emissions, i.e., a 50% reduction. However, looking at each sector in isolation can lead to inaccurate estimates of CO<sub>2</sub> emissions because the sectors interact.

Ms Kadri Simson, Commissioner of the European Commission – Energy  
Mr Thierry Breton, Commissioner of the European Commission – Internal Market  
Ms Adina Vălean, Commissioner of the European Commission – Transport  
Mr Mauro Patriccione, Director General of the European Commission – Climate Action  
Ms Ditte Juul-Jørgensen, Director General  
Ms Kerstin Jorna, Director General of  
Mr Henrik Hövel, Director General of Transport

Subject: Open letter to the European Commission regarding calculation of CO<sub>2</sub> emissions

Dear President von der Leyen,  
Dear Executive Vice-President Timmermans  
Dear Commissioner Simson,  
Dear Commissioner Breton,  
Dear Commissioner Vălean,  
Dear Director General Patriccione,  
Dear Director General Juul-Jørgensen,  
Dear Director General Jorna,  
Dear Director General Hövel,  
Dear Dr or Madam,

The IASTEC signers of this letter are representatives of technical universities with research focus in the field of energy, vehicle and drivetrain technology in Europe. We appreciate the EU's ambitions to reduce CO<sub>2</sub> emissions and we thank you for your efforts to establish a legislation framework. The recommendations of IPCC encourage us to quickly reduce the CO<sub>2</sub> emissions of all sectors including electricity and traffic. Especially the sector traffic must and will be completely sustainable and BEV/FCV as well as hybrid technologies have to support this goal.

However the signers kindly inform you about concerns, which we want to share with the most important policymakers of the EU to improve our energy system in an optimal way. After studying many position papers, drafts and even reviewed scientific publications and analyzing political declarations there are deep concerns of the signers, that the fundamental derivation of CO<sub>2</sub> emissions of the sector electricity is based on an insufficient calculus. Please note that the CO<sub>2</sub> impact  $\Delta F_{\text{CO}_2}$  (unit:  $\text{gCO}_2/\text{h}$ ) of an additional electrical consumer  $\Delta D$  is typically simplified in representative publications as  $M \Delta D$  (eq. 1). We

<sup>1</sup> IPCC: Intergovernmental panel of climate change  
<sup>2</sup> EU: average CO<sub>2</sub> footprint, i.e. Germany expectation for 2020: 244  $\text{gCO}_2/\text{kWh}$   
 $\Delta D$ : additional electrical consumer, i.e. 1 kW. Eq. 1: typical calculation reveals 244  $\text{gCO}_2/\text{h}$

kindly want to inform you, that the correct calculus is  $\Delta F_{\text{CO}_2} = M \Delta D + \Delta M \Delta D$  (eq. 2)<sup>3</sup>, according to the fundamental theorem of Leibniz from the 17<sup>th</sup> century. The additional contribution of the second summand  $\Delta M \Delta D$  depends on the status of the electricity system and is typically omitted very often. Please kindly note that the real CO<sub>2</sub> emissions (eq. 2) can exceed those of eq. 1 easily by more than factor 2, depending on the year and the status of the energy system!

As a consequence we must inform you, that due to the typically unprecise miscalculation of the CO<sub>2</sub> saving potential of additional contributors of the sector electricity is much more limited than expected by many politicians and communicated. This situation clearly is in

kindly want to inform you, that the correct calculus is  $\Delta F_{\text{CO}_2} = M \Delta D + \Delta M \Delta D$  (eq. 2)<sup>3</sup>, according to the fundamental theorem of Leibniz from the 17<sup>th</sup> century. The additional contribution of the second summand  $\Delta M \Delta D$  depends on the status of the electricity system and is typically omitted very often. Please kindly note that the real CO<sub>2</sub> emissions (eq. 2) can exceed those of eq. 1 easily by more than factor 2, depending on the year and the status of the energy system!

following the reFuels path:

Consequently we kindly comment, that the drivetrain with lowest possible CO<sub>2</sub> impact of a compact car, especially a hybrid diesel seems to be completely banned politically and economically although the CO<sub>2</sub> reduction potential of a combined Diesel Hybrid with R33 fuel amounts to roughly 50% in the year 2030, which is completely impossible for many countries with a BEV strategy, as eq. 2 must be considered! Therefore we vary kindly

$\Delta M$ : change of CO<sub>2</sub> footprint due to an additional electrical consumer  $\Delta D$  of 1kW.  
i.e. Germany expectation for 2020 and Dr-FW: 0.32  $\text{gCO}_2/\text{h}$  (GW)  
D: total amount of electrical consumer in GW, i.e. Germany expectation 2020: 57.6 GW  
 $\Delta D$ : Dr-FW: 0.32  $\text{gCO}_2/\text{h}$  (GW), Dr-FW: 0.318  $\text{gCO}_2/\text{h}$  (GW)  
Total equation 2:  $\Delta F_{\text{CO}_2} = 244 \text{ gCO}_2/\text{h} + 0.318 \text{ gCO}_2/\text{h} = 562 \text{ gCO}_2/\text{h}$ ; equation 1: 244  $\text{gCO}_2/\text{h}$

request you to recalibrate the scheduled legislation in the name of all EU citizens who expect an effective CO<sub>2</sub> reduction.

Please also consider the enormous technology leadership potential for Europe's industry in the field of reFuels production, trade and utilization.

We kindly express our vision that reFuels enable poor countries of the 3<sup>rd</sup> world to prosper by establishing reFuels based energy business with Europe.

Our concerns have increased that the centuries old dream of mankind of individual mobility for all populations in Europe will be significantly limited by the current BEV oriented strategy! We need all technical solutions including an improved BEV strategy. But the only

to enable automobile-based mobility for all regions in Europe in combination with CO<sub>2</sub> reduction is the intensive increase of reFuels production.

We kindly want to inform you, that important IASTEC partner regions of the world (i.e. Korea, Japan and USA) also recommend an intensive reFuels strategy. We request you to consider this assessment, as the internal combustion engine based drivetrain technology is expected to remain an important technology for decades if with fuel cell and battery vehicles. Instead we have nearly lost Europe's technical lead in the field of drivetrain technology due to partly imitating technology. Please, find additional information in our positioning paper which is signed by parts from Europe and all over the world!

reFuels express our thanks for considering our information and offer our willingness to get our knowledge, sincerely

Are low carbon reFuels a solution – a reFuels assessment

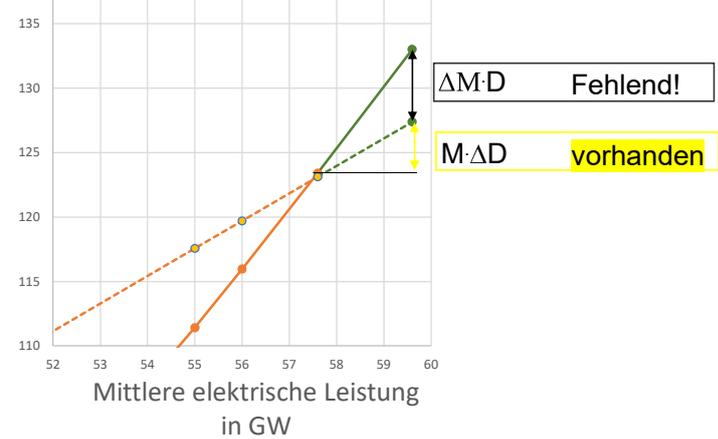

Institute of internal combustion engine research  
Prof. Dr. sc. techn. Thomas Koch

# The averaging bias

kindly want to inform you, that the correct calculus is  $\Delta F_{CO_2} = M \cdot \Delta D + \Delta M \cdot D$  (eq.2)<sup>3</sup>, according to the fundamental theorem of Leibniz from the 17<sup>th</sup> century. The additional contribution of the second summand  $\Delta M \cdot D$  depends on the status of the electricity system and is typically omitted very often. Please kindly note that the real CO<sub>2</sub> emissions (eq.2) can exceed those of eq. 1 easily by more than factor 2, depending on the year and the status of the energy system!

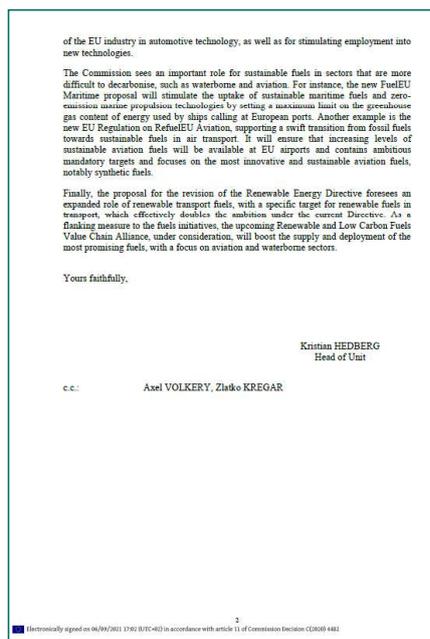

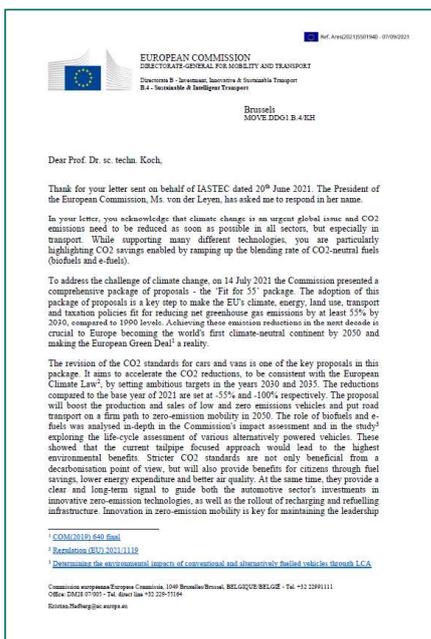

08.09.2021

Are low carbon reFuels a solution – a reFuels assessment

Institute of internal combustion engine research  
Prof. Dr. sc. techn. Thomas Koch

# 07.09.2021: Response of EU-commission

The revision of the CO<sub>2</sub> standards for cars and vans is one of the key proposals in this package. It aims to accelerate the CO<sub>2</sub> reductions, to be consistent with the European Climate Law<sup>2</sup>, by setting ambitious targets in the years 2030 and 2035. The reductions compared to the base year of 2021 are set at -55% and -100% respectively. The proposal will boost the production and sales of low and zero emissions vehicles and put road transport on a firm path to zero-emission mobility in 2050. The role of biofuels and e-fuels was analysed in-depth in the Commission's impact assessment and in the study<sup>3</sup> exploring the life-cycle assessment of various alternatively powered vehicles. These showed that the current tailpipe focused approach would lead to the highest environmental benefits. Stricter CO<sub>2</sub> standards are not only beneficial from a

## Overview

- 1 IPCC Guideline
- 2 Why reFuels?
- 3 Why IASTEC?
- 4 Critical discussion?
- 5 Summary

## Critical discussion of our argumentation

- A couple of very critical and partly inacceptable attacks towards our position paper and ZAMM publication were even embarrassing! Our petition to precisely define the CO<sub>2</sub> impact of electrical consumers is very strong, as we defined a mathematical axiom, which is valid for a mixed partly renewable partly non-renewable electricity system in general!
- What we should further improve:
- We often argue, that the existing fleet requires reFuels. This leads to the opinion, that reFuels are only necessary for a interim-period.

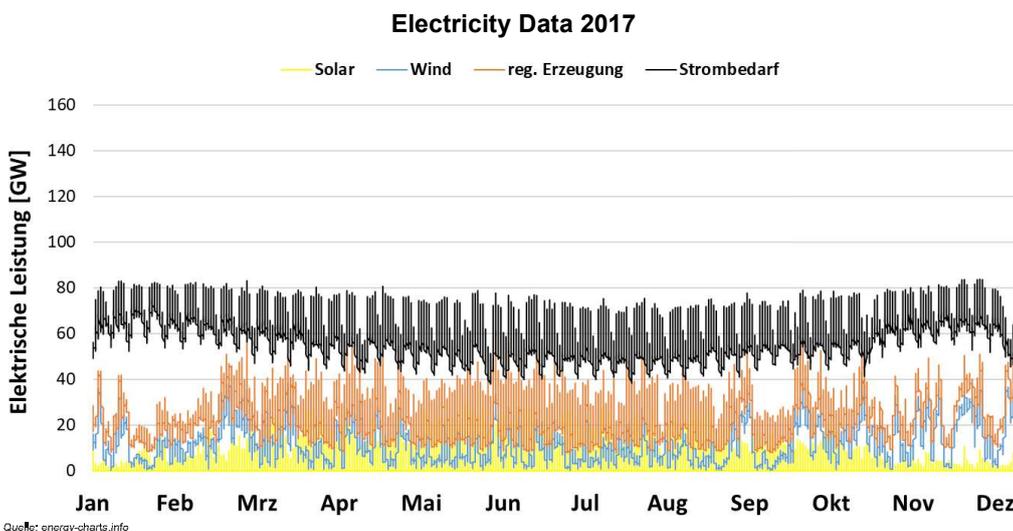

## Critical discussion of our argumentation

- We often argue, that it is impossible to quickly build up infrastructure and CO<sub>2</sub> free electricity. This argument is also transferred into: -> “but after a time period reFuels don´t make sense any more and are not required”
- We shouldn´t emphasize arguments leading to difficulties of raw material availability (copper, nickel), as we have the impression, that production difficulties are not seen a political issue.
- The political postulation to reduce individual pesscars from 450 to 150 cars/1000 inhabitants German is pushed. We should not argue with cost or social unequities (poor people not able).
- We need to emphasize the negative impact on tax, jobs, environment, political stability.

# Thank you for your attention

## Reference electricity demand for analysis

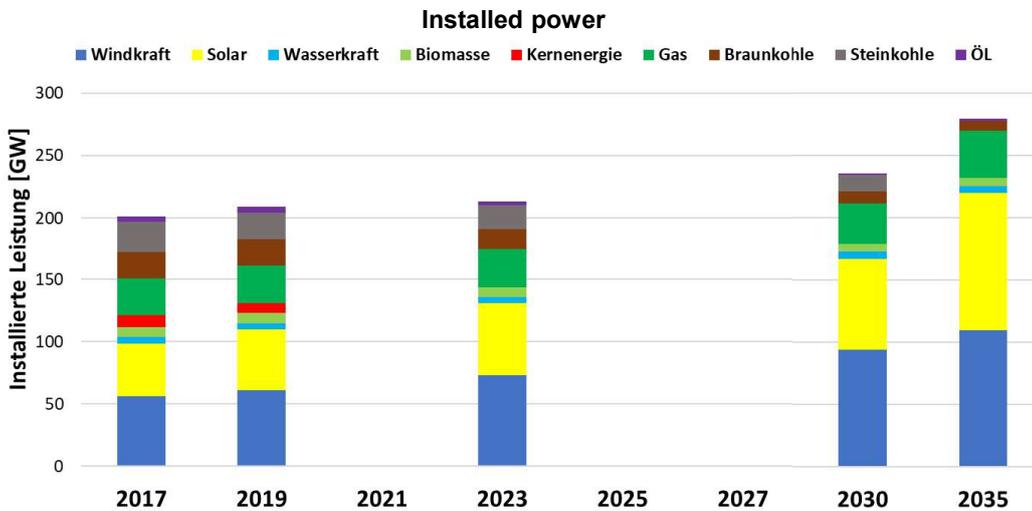

### Boundary conditions of analysis

- The analysis is based on hourly-resolved real-time data from the network operators from 2017
- The balance limit is Germany.
- Balance flows across system boundaries (import and export flows) are considered.
- A comparison with the integral parameters of the year 2019 shows the general transferability of the approach.

The expansion of wind power and photovoltaic plants is making an increasingly effective contribution to Germany's overall energy balance. 2017 was used as the reference year for the analyses.

# Expansion potential of wind power and photovoltaics

Quelle: Bundesnetzagentur für Elektrizität, Gas, Telekommunikation, Post und Eisenbahnen, „Genehmigung des Szenariarrahmens 2019-2030“, „Genehmigung des Szenariarrahmens 2021-2025“.

## Explanation „installed power“

- The expansion of installed capacity, primarily of wind power and photovoltaics, is based on the analysis of the Federal Network Agency of 15.06.2018 and 26.07.2020.

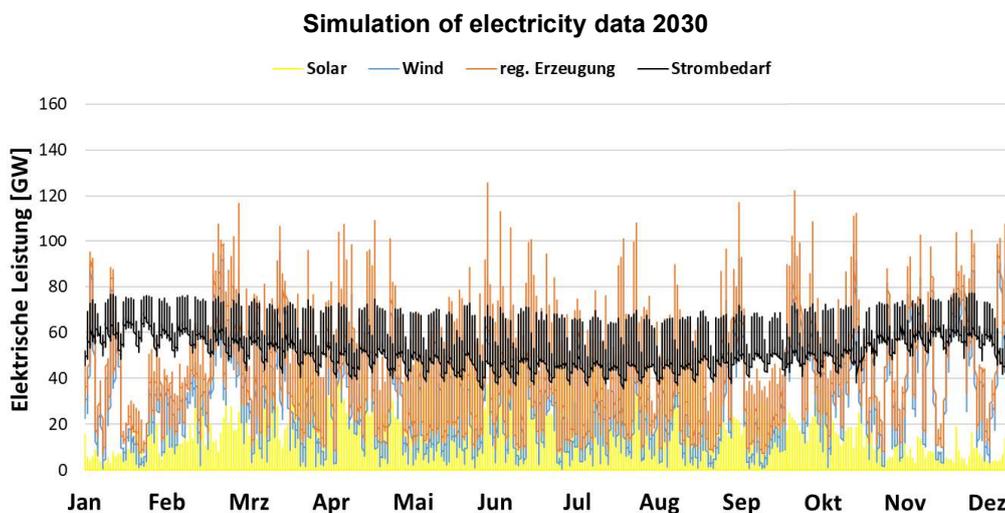

- The following increase in installed capacity is forecast:

Period	Wind power	Photo-voltaic
2030 vs. 2017	69%	72%
2035 vs. 2017	96%	160%

- The proportion of installed capacity accounted for by "renewables" is approx. 76% in 2030 and approx. 83% in 2035

**Expansion of wind power and photovoltaics will increase strongly in the coming years. The expansion targets assumed in the selected scenario framework are ambitious and are taken as given.**

# Hourly-resolved simulation 2030

## Explanation „analysis 2030“

- The analysis shown on the left is a combination of 2017 real-time data and installed capacity build-out data.

- Wind is analyzed separately onshore and offshore, but listed together in the figure.

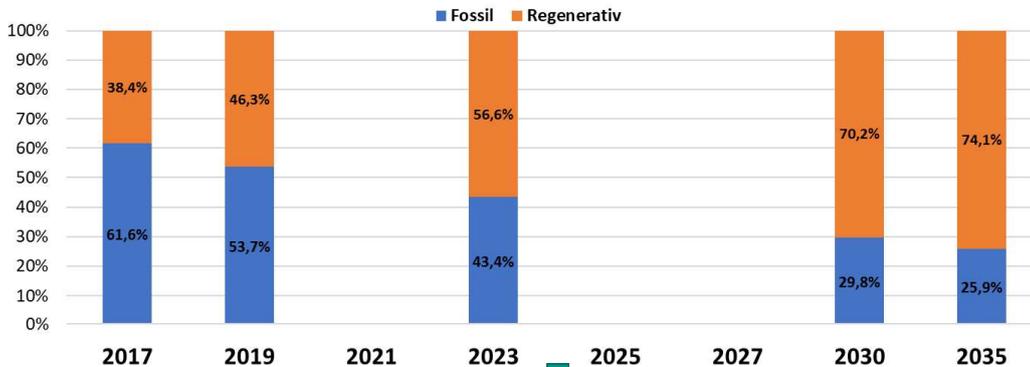

- Also in this representation on the left is the basis

- 0 BEV Scenario
- Expansion of heat pumps according to scenario specifications.

**The sum of photovoltaics, wind power, hydropower and biomass is summarized as "non-fossil generation". The non-fossil minimum / peak sum capacity is approx. 7/126 GW in 2030.**

# Balance sheet analysis

Integral share of electricity production

Quelle: energy-charts.info, Bundesnetzagentur für Elektrizität, Gas, Telekommunikation, Post und Eisenbahnen, „Genehmigung des Szenariorahmens 2019-2030“, „Genehmigung des Szenariorahmens 2021-2025“

## Explanation CO<sub>2</sub> footprint

- The balance (left) results from the scenario framework.
- The CO<sub>2</sub> footprints are:

Technology	g CO <sub>2</sub> / kWh
Hydropower	23
Wind power	9
Photovoltaics	50
Biomass	70
Gas	499
Brown coal	1075
Hard coal	830

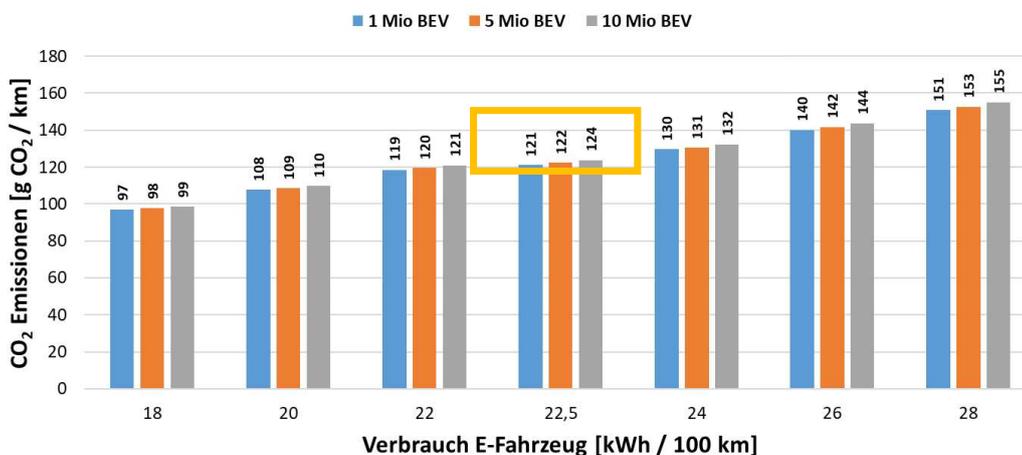

Quelle: Fraunhofer ISE, www.pv-fakten.de

	2017	2019	2023	2030	2035
Footprint of electrical energy g CO <sub>2</sub> / kWh	412	363	370	244	198

A footprint of 198 g CO<sub>2</sub> / kWh leads to a theoretical value of 45 g CO<sub>2</sub> / km for 22.5 kWh / 100 km (BEV).

# BEV CO<sub>2</sub> emissions 2030

CO<sub>2</sub> emissions 2030

## Explanation „spec. CO<sub>2</sub> emissions“

- For example, for 10 million BEV vehicles, this results in 17.3 million tons of additional CO<sub>2</sub> emissions at 14.000 km/year per vehicle and 22.5 kWh / 100 km.
- The left illustration shows a different electrical energy demand.
- Of course, higher electrical energy demand also increases the CO<sub>2</sub> footprint.

For the electric energy demand of 22.5 kWh / 100 km, the CO<sub>2</sub> emission in 2030 is between 121 and 124 g CO<sub>2</sub> / km depending on the number of vehicles!

## Questions, answers, and comments

Q. The present situation in Germany regarding to the change ratio of electrical energy and push of regeneration energy will not be enough to drive the electrical vehicles in the future. Is that the basic message?

A. Basic message is the CO<sub>2</sub> impact to the electricity sector is significantly higher than assumed. According to German renewable energy law, photovoltaic and wind turbine has low impact and were preferred. However, the CO<sub>2</sub> impacts increased as the electricity demand is increased. Question is how the additional electricity demand will interact with the CO<sub>2</sub> impacts. Political report only used multiplication of the average CO<sub>2</sub> emission value times electricity demand, but the CO<sub>2</sub> emission value also interacts with the electrical demand, two times more than the average when the electrical demand is high.

Q. According the different fuel blend from your PowerPoint, 33% e-fuel for diesel, 40% e-fuel for gasoline to 50% and towards 100%. What are the future components of R100 and G100 when you are aiming for 100%?

A. Importance is the path how we will produce the paraffine diesel and methanol. Different path to produce paraffine diesel and methanol such as biomass, electrolysis, gas-shifting, but Ethanol and Methanol are the major components for Gasoline and Paraffine Diesel is the major component for the diesel.

Q. But in that case, we need something with high density because we will suffer from too little benzene quantity if we increase the paraffine portion.

A. Adding additives is required.

C. Even if we provide all the electricity with renewable energy, there is another problem with how we store the energy because electricity is not storable. Liquid fuel is a perfect way to store energy and transport compare to the battery.

International Workshop on the Application of Carbon-neutral Fuel, September 9<sup>th</sup>, 2021

Prof. Dr. Ing. Frank Atzler

## Primary Energy Consumption in Germany

Source: Arbeitsgemeinschaft Energiebilanzen, 2019\* <https://www.ag-energiebilanzen.de/>

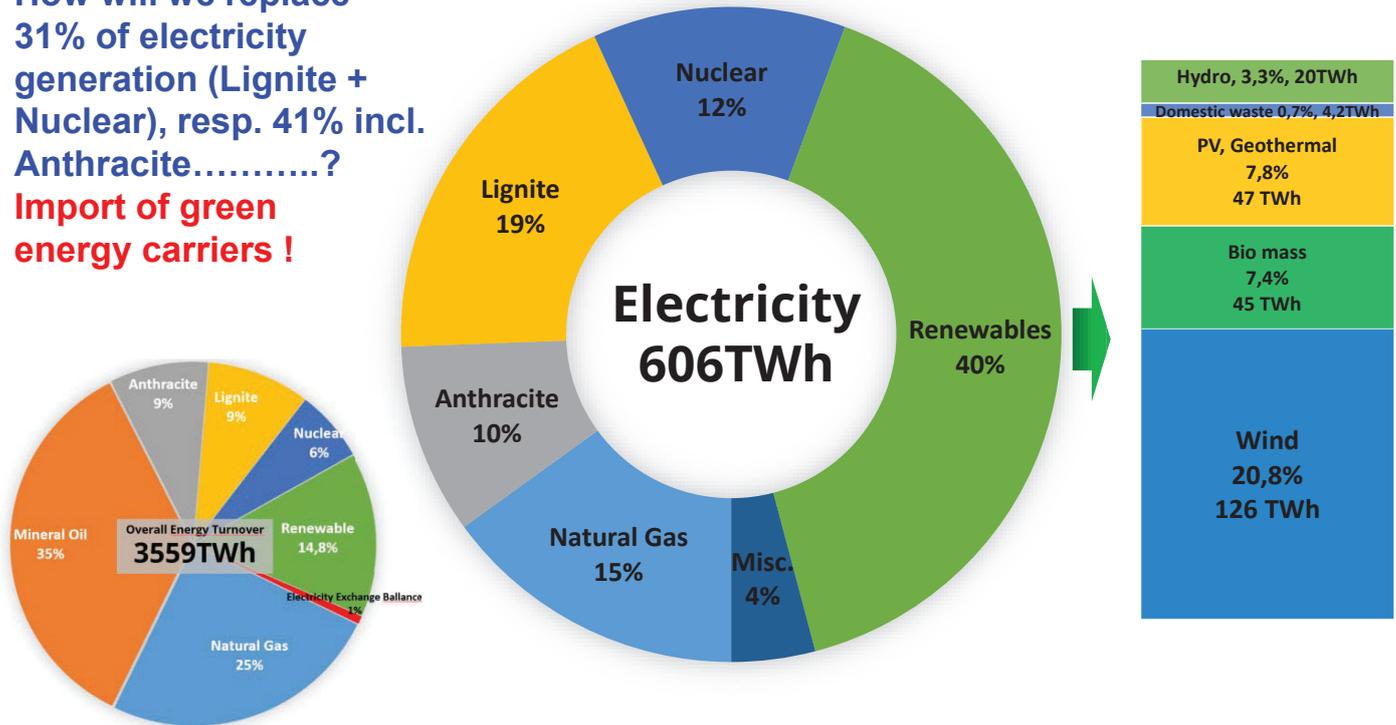

- 1) only **14,8%** (2020: 16,8%) of the overall primary energy consumption are covered by renewables
- 2) only **5%** of the overall primary energy consumption are supplied by wind and photovoltaics
- 3) Germany/Europe will always be dependent on energy imports, **currently nearly 70% of primary energy\***
- 4) Which energy carrier is suitable for long distance transport über weite Strecken? Electricity, H<sub>2</sub>, liquid reFuels?

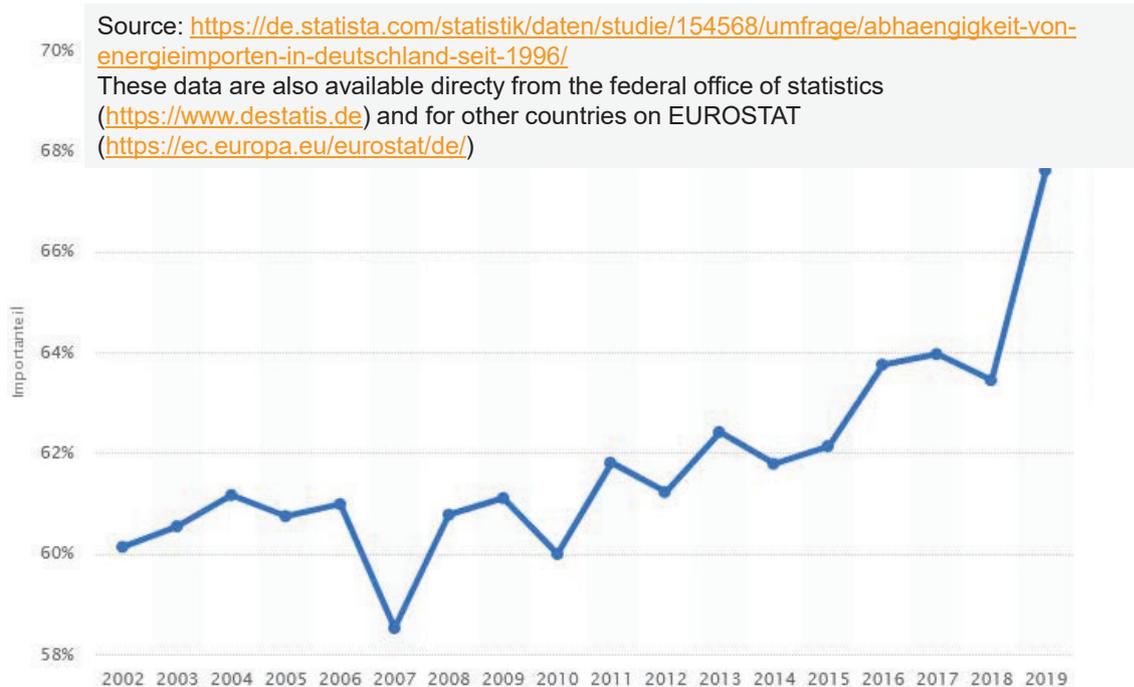

# Electricity Generation in Germany 2019

Source: Arbeitsgemeinschaft Energiebilanzen, Stand 2019 <https://www.ag-energiebilanzen.de/>

How will we replace  
31% of electricity  
generation (Lignite +  
Nuclear), resp. 41% incl.  
Anthracite.....?  
**Import of green  
energy carriers !**

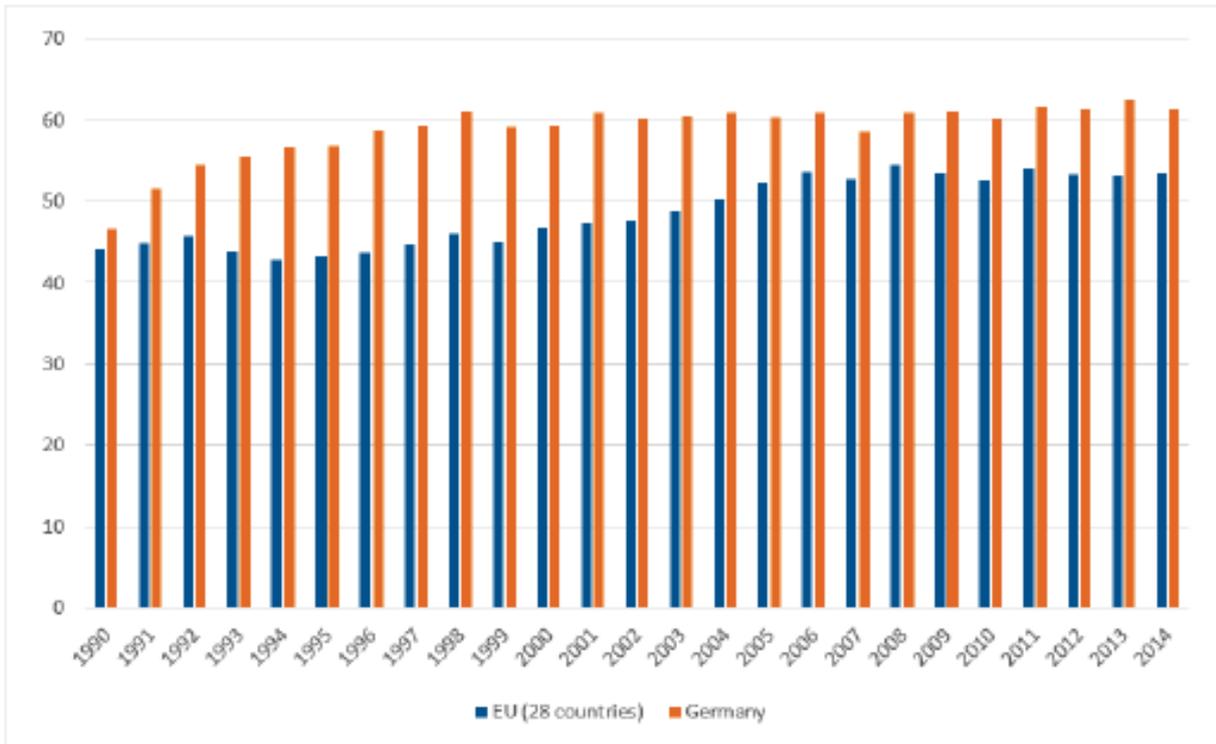

## Energy Import to Germany, Share of Primary Energy Demand

Energy imports should be made in a form that **can be stored**. This is important to cover import and supply fluctuations of any kind. A self-sufficient energy supply will hardly be possible in Europe.

# Energy import to Europe/Germany 1990 - 2014

Source: Eurostat

## Electricity production: wind energy Self-sufficient Germany?

Number of wind turbines in Germany 2018: **30518** → 126TWh yield in 2019

Sources: Bundesverband Windenergie, Umweltbundesamt, Bundesnetzagentur + www.smard.de

Basis: Primary Energy Consumption in Germany 2021, estimate app. 3500TWh					
Zahl der Anlagen	Full Load Power	Overall Power	Load Factor	Energy harvest	Fraction of 3500TWh
n	MW	MW		TWh/a	%
60000	3	180000	0,23	363	10,4%
	Turbines per Windpark	Surface of Gemya	Surface Square per Park	Distance between Windparks	
	-	km2	km2	km	
60000	10	357000	59,5	<b>7 to 8km</b>	

→ „each village its own wind park“ → citizen participation? → nevertheless scenarios with 60000 wind turbines are rather unlikely.

# Electricity production: photo voltaics

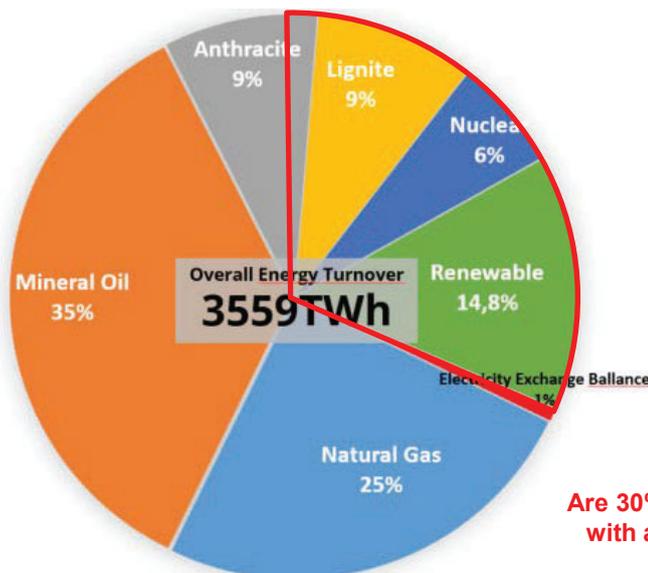

## Self-sufficient Germany?

Germany, km2	Germany, m2	Average Yield in kWh/m2/a	Total yield for all of the surface, in kWh/a	Conversion kWh in TWh, /10 <sup>9</sup>		
357000	3,57E+11	1100	3,927E+14	392700		
Total of sealed surfaces in Germany		5%	Source: IGR Monitor			
Populated area		12,50%				
theoretical yield from 1% of the surface, in TWh:				3927		
Overall Primary Energy Consumption, est. for 2021				3500		
On 3% of Germany's surface enough energy could be harvested theoretically to produce Methanol at an efficiency including all losses of 33% (Methanol production from electrolysed Hydrogen is rated at an efficiency of app. 50%)						
Methanol is a chemical energy storage for darkness and dead calm (no wind at all) as well as for winter, and engines can be run with it CO2 neutrally						
3% of Germany's surface, km2:		10710	10710 PV-Parks, 1km2 each per surface unit of X in km2:			33,33
			Distance between PV parks 5,75km (6 x 6 = 36km2)			

Sources: own calculations, Atzler, TU Dresden, Fraunhofer ISE, Stromgestehungskosten erneuerbare Energien, Juni 2021, energy yield Germany 950 (north) to 1300kWh/m<sup>2</sup>/a (south) → mean 1125

## Primary Energy Consumption in Germany

Source: Arbeitsgemeinschaft Energiebilanzen, 2019\* <https://www.ag-energiebilanzen.de/>

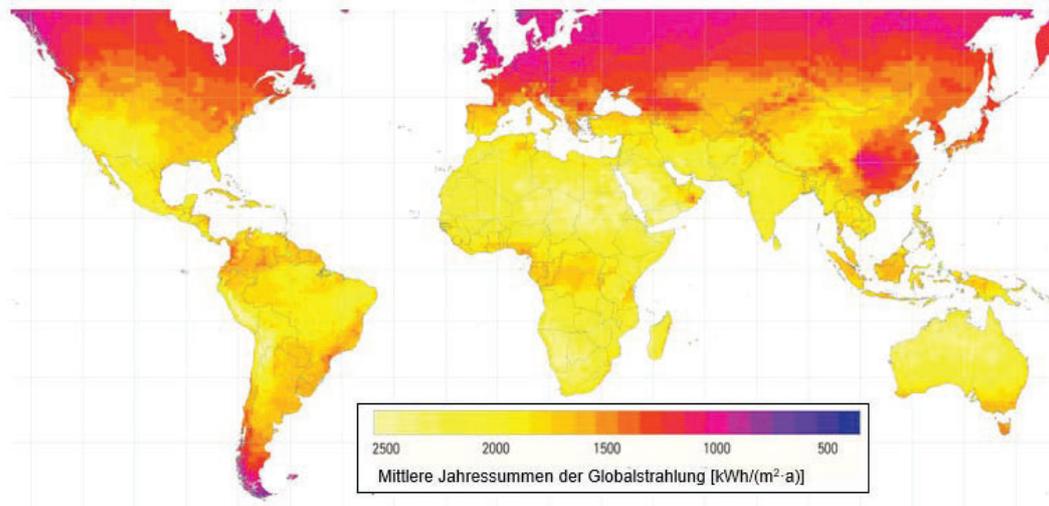

Are 30% renewables produced nationally realistic with administrative rules and citizen protests?

- 1) only **14,8%** (2020: 16,8%) of the overall primary energy consumption are covered by renewables
- 2) only **5%** of the overall primary energy consumption are supplied by wind and photovoltaics
- 3) Germany/Europe will always be dependent on energy imports, **currently nearly 70% of primary energy\***
- 4) Which energy carrier is suitable for long distance transport über weite Strecken? Electricity, H<sub>2</sub>, liquid reFuels?

# Photovoltaics, world map of sun energy

Konrad Mertens, "Photovoltaik - Lehrbuch zu Grundlagen, Technologie und Praxis", Hanser Verlag, 2020

Average yield in Germany app. 1100kWh/m<sup>2</sup>/a

Yield in the „sun belt“ of the world: up to 2500kWh/m<sup>2</sup>/a → Factor 2,27 → economical production!

Geopolitical questions:

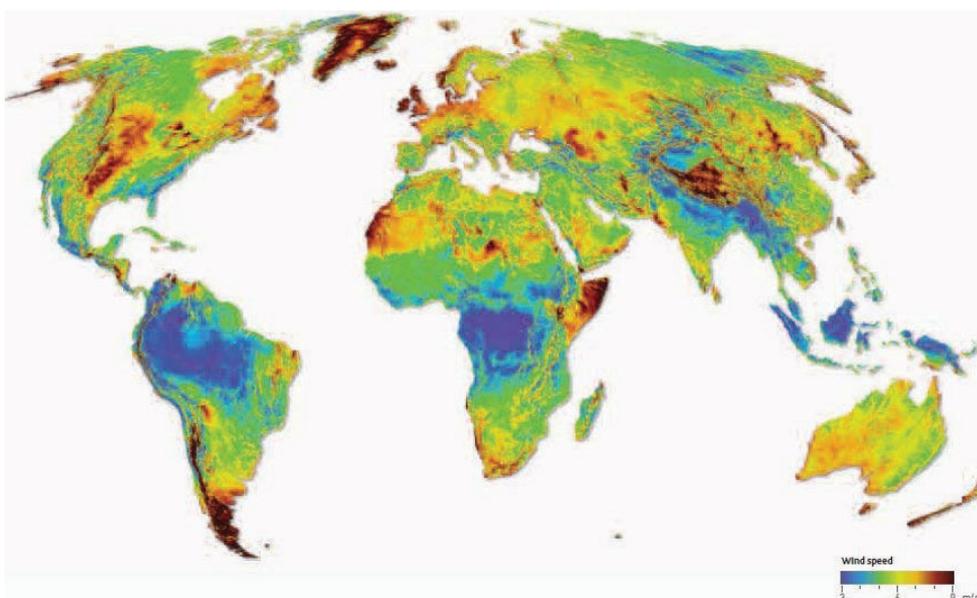

Spain, Portugal, South of Italy, Greece → within the EU

Turkey, Australia, Brasil, Chile, Argentine ? Regions of Africa?

USA, China and Indien are assumed to use their ressources themselves

# Wind map of the world, wind speed 80m above ground

<https://crushtymks.com/wind-power/1607-what-about-the-worlds-wind-resources.html>

Areas with elevated wind potential:  
near coastal regionen of Europe (Atlantic, north sea, baltic sea), Russia, Alaska, Canada, Patagonia, Greenland, South Africa and Australia, North-West-Africa, Central USA

Germany: ca. 7m/s  
Potential areas: 9 m/s

# Energy logistics across the world

## The challenge of volumetric Energy Density

- **Hydrogen H<sub>2</sub>:** Liquid at -253 °C: 71 kg/m<sup>3</sup> → **2343 kWh/m<sup>3</sup> = 2,34 kWh/Liter**  
Liquefaction consumes some 25 - 40% of the energy content of H<sub>2</sub> → 1,4 - 1,8 kWh<sub>eff</sub>  
gaseous, 700bar: 43 kg/m<sup>3</sup> → **1419 kWh/m<sup>3</sup> = 1,42 kWh/Liter**  
Compression to 700bar consumes app. 15% of the energy content of H<sub>2</sub> → 1,2kWh<sub>eff</sub>

- **Green Fuels synthesised from H<sub>2</sub> und recycling carbon (CO<sub>2</sub>)**

Example: **Methanol:** 790 kg/m<sup>3</sup> → **4425 kWh/m<sup>3</sup> = 4,43 kWh/Liter**

Compare: Diesel, 835kg/m<sup>3</sup> → 9740kWh/m<sup>3</sup> = 9,74kWh/Liter

- ✓ Storage, Logistics, Infrastructure

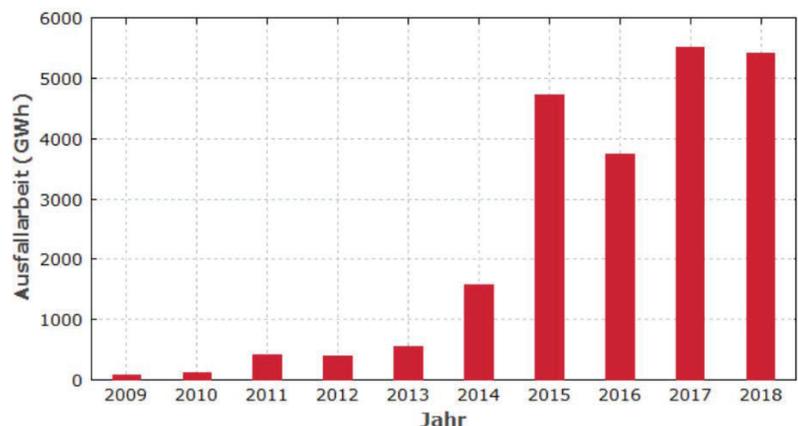

**Not the alternative with the highest efficiency will win, but the one which offers the best compromise.**

**Mostly this will relate to overall cost**, which covers for cheapest energy production, best handling and logistics. But also **availability, scalability to immense quantities and robust and cheap production** will be essential, as well as the **electricity generation in darkness, calm (no wind), and winter**. Also the **strategic reserve** of any nation, i.e. the energy storage for e.g. 6 months and last but not least **easy handling and comfort for the customer**.

## „Waste wind energy“ also called „Ausfallarbeit“, „Überschussstrom“

- with the introduction of renewables, Wind and PV, there is more volatile energy in the European distribution network → production peaks can often not be used and must be compensated for with huge effort to maintain net stability
- → excess electricity could be used for electrolysis and PtX production
- **But how much excess energy is there?**

- **5,5TWh corresponds to only 0,15% of primary energy turn over**
- **reFuel production from „excess energy“ is by far insufficient, a dedicated energy strategy is needed!**

Source: Bundesnetzagentur und <https://www.energie-lexikon.info/ausfallarbeit.html>

# Efficiency of the production and use of regenerative fuels Comparison to driving with electricity directly

Assumption: 100% energy (green column) is used to:

- drive a battery electric vehicle (blue)
- to run a fuel cell vehicle with hydrogen
- to run a Diesel vehicle with synthetic Diesel

In all of these scenarii the production of the vehicle and in particular the **CO<sub>2</sub> intensive production of the battery is not included, nor is the infrastuctur to produce the necessary amount of green energy !**

Glossary:

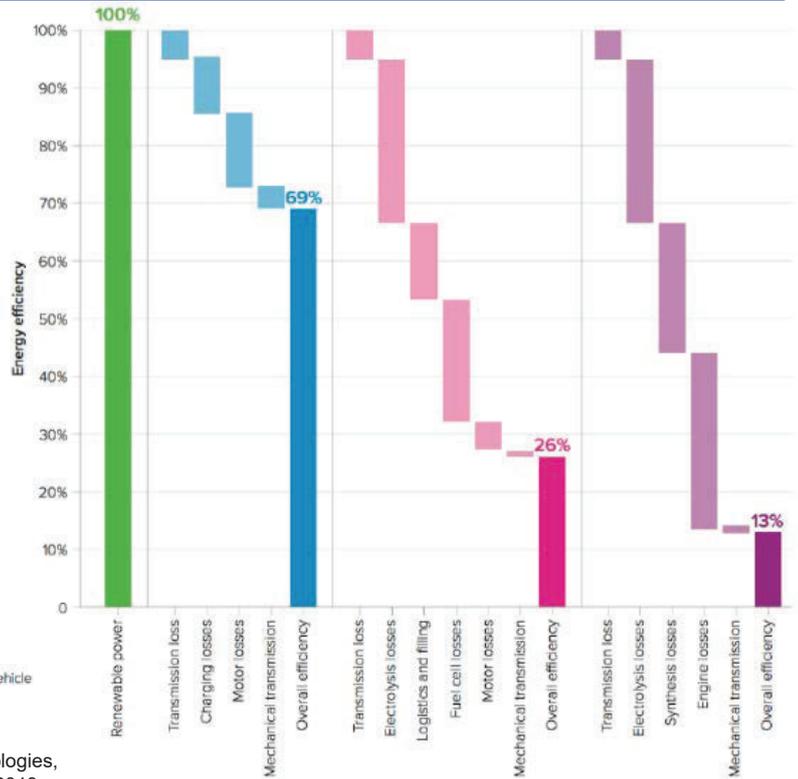

**Transmission loss** → losses in the electric Grid

**Motor losses** → losses in the electric motor, efficiency of the eMotor

**Logistics and filling** → storage, transport of H<sub>2</sub>, both liquid and gaseous, consume energy. The filling process (of tanks), i.e. the transfer of H<sub>2</sub> from one vessel to another requires energy and incurs loss of H<sub>2</sub> (leakage, boiling losses, ....)

**Synthesis losses:** are a matter of debate and depend very much on the synthesised fuel. E.g. H<sub>2</sub>+CO<sub>2</sub> → Methanol is an exothermic reaction, CO<sub>2</sub> can be captured „out of the air“ (400ppm vol → very energy consuming!) or „from industrial combustion“ (85% vol)

■ Renewable power ■ Battery Electric Vehicle ■ Fuel Cell Vehicle ■ Efuel Diesel Engine Vehicle

Quelle: Matthew Davidson, Centre for Sustainable and Circular Technologies, University of Bath, at the IMechE IC Engines, Birmingham, December 2019,

## Conclusions (short version)

- **Industrialised countries are likely to depend on energy imports**, when the available land surface and the yield from wind and PV is limited.
- For this import only energy carriers are suitable with simple, scaleable, robust and cheap production, reasonable volumetric energy density and simple handling .
- **Green electricity resp. Hydrogen as base substance will be needed in vast quantities → there is by far enough energy from the sun belt of the earth**
- for **mobile applications** and **long distance energy logistics** liquid fuels have essential advantages in energy density, handling and range vs. gaseous fuels.
- splitting liquid fuels back into hydrogen does not make any sense. Combustion engines can use these fuels directly and energy storage also is solved with liquid fuels.
- Nowadays the cleansing of combustion engine emissions is a solved issue.

## Conclusions (long version)

### We will need ALL technologies, battery-electric, Hydrogen, eFuels !

- Germany or any other industrialised country with limited geographical and geological resources will always remain dependent on imports. Nevertheless the **share of renewable energies** must be increased vastly from currently **less than 20% of the total energy turnover**. This includes all forms of energy, not only electric (mechanical, heat).
- Subsequently this is only possible in a **globalised energy economy**, where the transfer of energy will only be possible in few cases by cable (electricity) or pipeline (Hydrogen, natural gas).
- The **transport of Hydrogen** in pipelines will be favourable for some application e.g. a national grid. However, for long distance transport its **volumetric energy density is unfavourably low, supercooling and compression energetically not sensible**.
- A **liquid energy carrier with reasonable volumetric energy density**, which can be produced with **reasonable efficiency, robustly, simple and scaleable to huge quantities** is Methanol. (Source: e.g. Prof. Bertau (Bergakademie Freiberg) et.al. Methanol: The basic Chemical and Energy Feedstock of the Future, Springer Verlag; Prof. Robert Schlögl, Fritz-Haber-Institut der Max-Planck-Gesellschaft, Berlin). **Methanol** is liquid at ambient pressure and temperature, i.e. handling is simple. It can be used in fuel cells and combustion engines. Toxicity appears to be one topic of discussion, however, gasoline is not less toxic and intoxications are rather rare! Methanol can be processed to eKerosene and eDiesel, as well as eGasoline to serve to **defossilise the existing vehicle fleet**. Also other renewable fuels, e.g. from waste, appear attractive from their energetic balance as well as cost → Prof. Willner, HAW Hamburg
- **Closed Carbon Cycle** → **H<sub>2</sub> electrolysed from green electricity** and synthesised with **recycled carbon(dioxide) to new fuel**.
- **direct air capture of CO<sub>2</sub>** → currently still **complex and expensive**, because the **concentration in air is only 0.04%**.
- **Recycling from so called point sources (= industrial plants) is much less complex and cheaper (app. factor of 4)**. For a long time to come there will be a **sufficient number of point sources** (waste incineration, concrete works, others) **to satisfy the Methanol/energy demand of the world**. The **CO<sub>2</sub> concentration in such exhaust gases is some 5 – 15%** (depending on process and operation condition). The fuel produced from recycled carbon will then be CO<sub>2</sub> neutral, not CO<sub>2</sub> free. **Nevertheless, the carbon footprint will still be vastly reduced**.

#### Sensible market division:

- **short distance and low power density** applications → **battery electric**
- **middle distance und medium power** (distributors, communal vehicles, bus fleets) → **hydrogen combustion engine** (technology quickly available, transient operation needs some development) and **fuel cell** (not in serial production yet)
- **long distance and high power demand**: long haul trucks, building and agricultural machinery (refuelling, operational hours per day), railways which cannot be electrified economically, aviation → combustion engines with **eFuels from various sources**

## Questions, answers, and comments

Q. Whenever we have argument about this with people from other field, they talk about economic liability and efficiency. Can you mention quantitatively?

A. I have not researched overall efficiency in depth. However, according to a swiss magazine article, energy generation with stream turbine and coal fire plant, efficiency is 35-40% and combined efficiency is 80-85%. It is unfair comparison since the heat can be generated elsewhere and this is what Thomas argued. Increased electricity because of the battery car will be generated from the fossil fuel.

C. Electrical car is more energy efficient. However, from the hybridization, modern Truck efficiency is 40-42% and passenger car is 40%.

Q. If you would convert the strategic oil reserve in US to equivalent energy quantity of batteries, you need to spend 5000 years of global GDP.

A. Methanol as the basic substance, low burstiness, cheapness, and durability, but not efficiency. Under 1cent/kwh in Saudi Arabia PV

# Green Innovation Fund (2021-2030)

• 2 trillion yen (15 billion EUR) for 10 years, managed by NEDO

### Priorities

1. Off-shore wind
2. Next-generation PV
3. Large-scale hydrogen supply-chain \*\*
4. Electrolysis for green hydrogen \*\*
5. Hydrogen steel-making
6. Fuel ammonia supply-chain
7. CO2 recycling for plastic materials
8. **CO2 recycling for fuels (auto, aviation, residential/commercial)** < CFP is planned >
9. CO2 recycling for concrete products
10. CCUS
11. CO2 capturing technology at incinerators
12. Next generation batteries and motors
13. Innovative supply-chain for automotive electrification
14. Smart Mobility Society
15. Next generation digital infrastructure
16. Next generation aircrafts \*
17. Next generation ships \*
18. CO2 reduction / storage in Foods, agriculture, forestry and fisheries

\* Call for proposals (CFP)  
\*\* Announcement of adopted projects

# Policy: Carbon Recycling Roadmap

## Roadmap for Carbon Recycling Technologies (originally in June 2019, updated in July 2021)

### E-Fuel: Starting from SAF, then to road fuel (E-Fuel)?

• NEDO adopted FT synthesis Fuel project (from NEDO news release)

Project: P&D on carbon recyle liquid fuel using CO2 (Feb 22, 2021)  
[https://www.nedo.go.jp/news/press/AA5\\_101410.html](https://www.nedo.go.jp/news/press/AA5_101410.html)

**Unofficial Translation**

**Topics**

- R&D on innovative FT synthesis
- P&D on synthetic liquid fuel production process using renewable electricity

**Project Team**

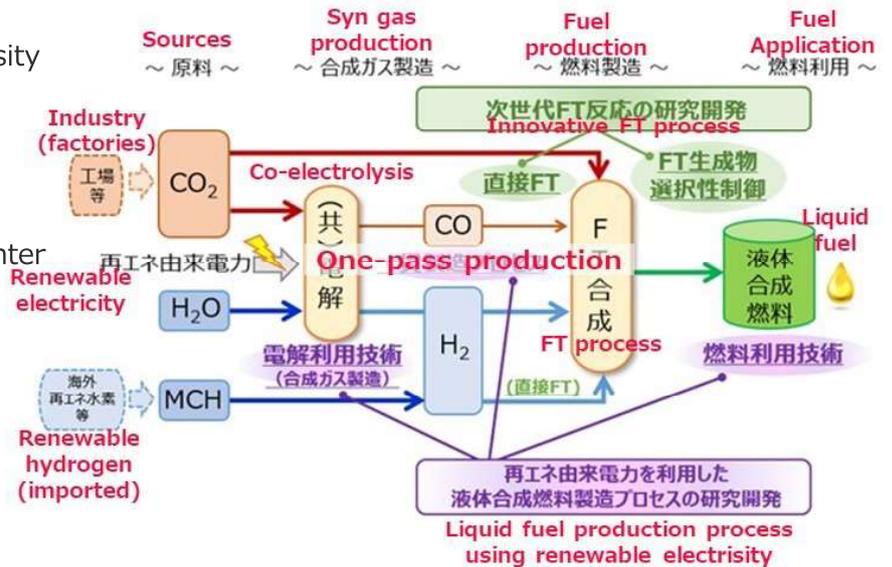

- Seikei Gakuen Seikei University
- ENEOS Corporation
- Nagoya University
- Yokohama National Univ
- Idemitsu Kosan Co., Ltd.
- AIST
- Japan Petroleum Energy Center

**Project Term**

- FY 2021-FY 2024

**NEDO Budget**

- 4.5 bil yen (34 mil EUR)

## Toward Carbon-Neutral E-Fuel

**Disclaimer**

The information, including translation, analysis and comments in this presentation are those of the author and do not necessarily reflect the official position and opinion of neither the Japanese Government nor any Japanese companies.

# What is the Carbon-neutrality of E-Fuel?

- E-Fuel: Hydrogen – Clear, CO2 – Where?

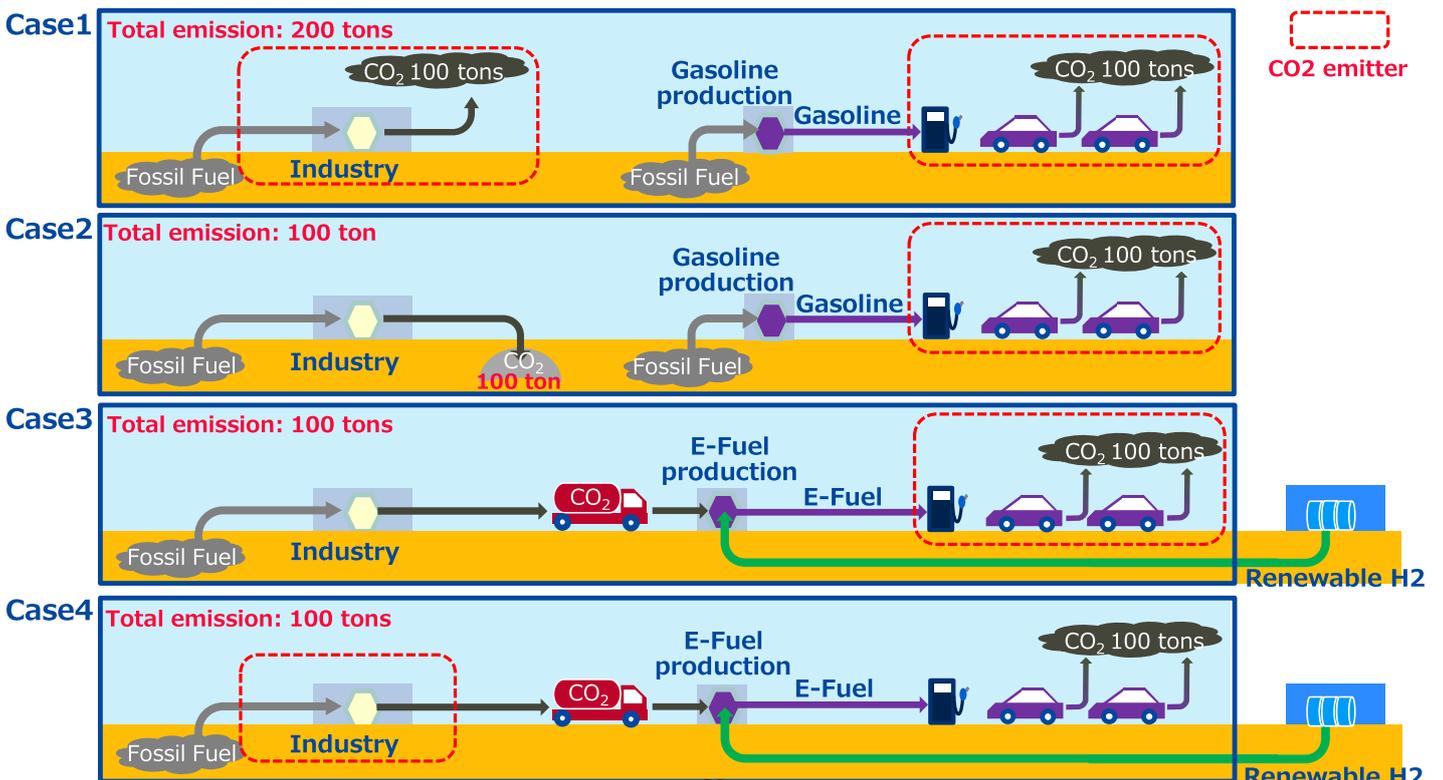

Source: METI "Green Synthetic liquid fuels" (featured contents)

Unofficial Translation

Sept 9 2021 / © TECHNOVA .INC All Rights Reserved.

# Carbon-neutrality of E-Fuel (1)

- With industry-based CO<sub>2</sub>, E-fuel is not carbon-neutral

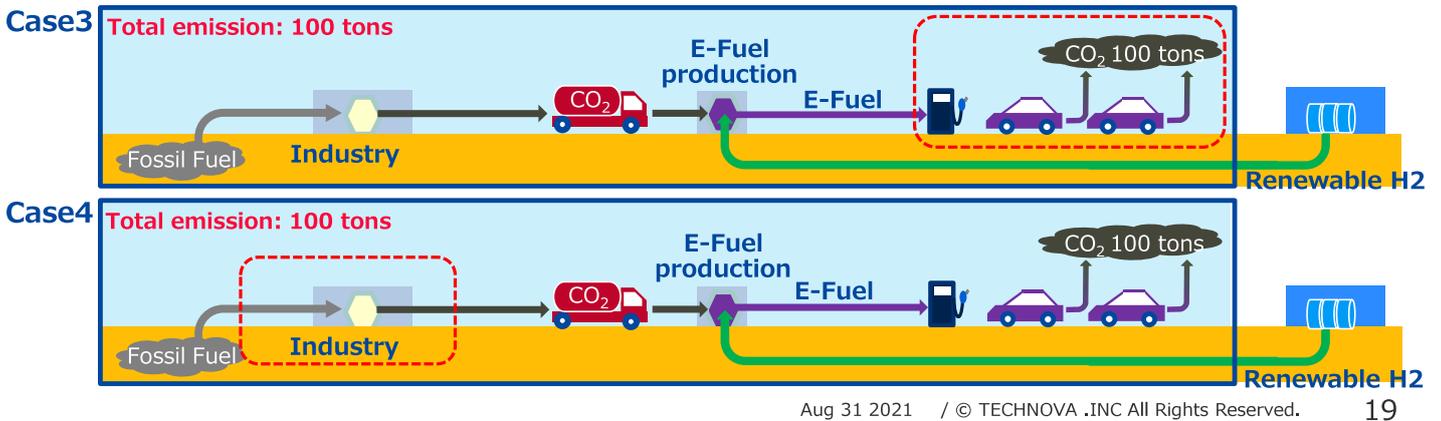

# Carbon-neutrality of E-Fuel (1)

- With industry-based CO<sub>2</sub>, E-fuel is not carbon-neutral

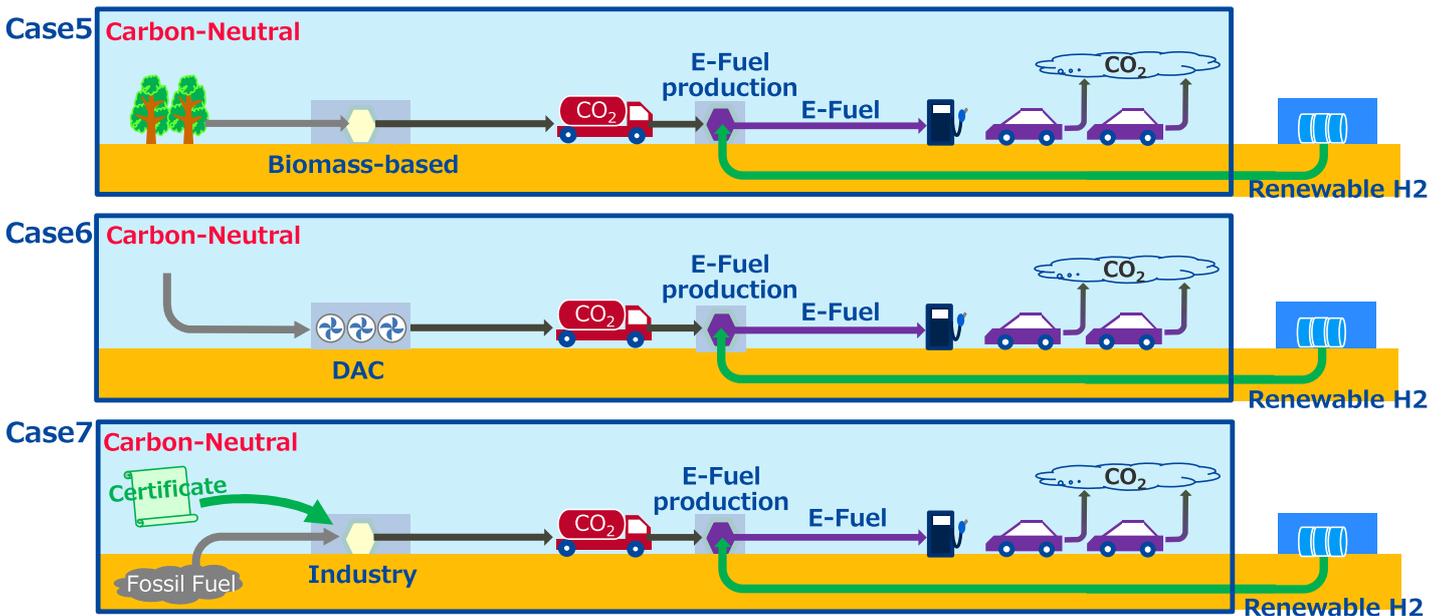

CO<sub>2</sub> emitter

- Using fossil fuel-based CO<sub>2</sub>, E-Fuel is not carbon-neutral.
- The overall CO<sub>2</sub> emission reduction is no more than 50%

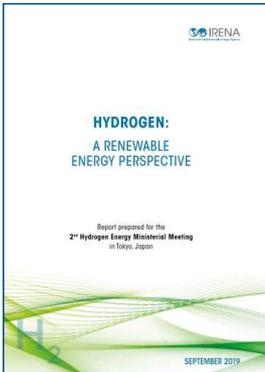

# Carbon-neutrality of E-Fuel (1)

- To make E-Fuel carbon-neutral, there are several ways...

- For carbon-neutral E-Fuel, DAC is an option.

- DAC offers significant potential for E-fuel

IRENA  
"Hydrogen:  
A renewable energy  
perspective"  
(Sept 2019)

## Direct air capture of CO<sub>2</sub>

Because a primary driver for the energy transition is abatement of greenhouse gas emissions, the source of the CO<sub>2</sub> used for producing e-fuel is important. **If the CO<sub>2</sub> is captured from a fossil fuel combustion process** (e.g., a power plant) and is reacted with renewable hydrogen to yield an e-fuel, and **this e-fuel is used to replace fossil fuel (e.g., jet fuel), then the total CO<sub>2</sub> emissions of both processes are halved.** However, this is **not in line with the Paris climate objectives**, which require significant de-carbonisation of the global economy in the second half of this century.

This leaves as **options only CO<sub>2</sub> from biomass combustion and from direct air capture (DAC).** The first option is less costly yet limited in potential (e.g., biomass combustion is only possible in large power plants, biofuel refineries, bagasse boilers and pulp plants). **The second (DAC) is costlier but has unlimited potential**, provided that significant cost reductions take place and that the price for CO<sub>2</sub> is sufficient to support investments in such technologies.

21

## Conclusion

- **Policy: Zero Carbon by 2050 and Green Growth**  
**Policy: Carbon Recycle**
  - Under Green Innovation Growth Initiative, Government promotes hydrogen, ammonia and **E-Fuels**.
  - E-Fuel can contribute to industry growth as well as decarbonization.
  - E-Fuel may be introduced into the market **around 2040**.
  - E-Fuel may start from **SAF**, and then to **road fuel**.
- **Toward Carbon-Neutral E-Fuel**
  - If fossil-fuel based CO<sub>2</sub> for E-Fuel, “someone” must be responsible for CO<sub>2</sub> emission (and **CO<sub>2</sub> emission reduction is no more than 50%**)
  - To guarantee **carbon neutrality** for E-Fuels, DAC technology is the key.
  - **Carbon neutral E-Fuels** can compete with other carbon-neutral technologies (electricity, green/blue hydrogen and others).

## Questions, answers, and comments

Q. All of the activities you mentioned need a lot of investment and legal agreement. Do you seem such a plan you proposed by the committee that implement the conditions and investment find business potential?

A. We need international discussion, which we are going to do. We have to understand global big picture. Our government will support the vision, as long as it supports the decarbonization.

# ReFuel 2021

## **E-fuel contribution via R&D in Finland**

# E-fuels as energy carriers for hard-to-abate sectors

## Promising examples:

- Methane
- Methanol
- Ammonia
- Hydrogen
- FT fuels
- Dimethyl ether

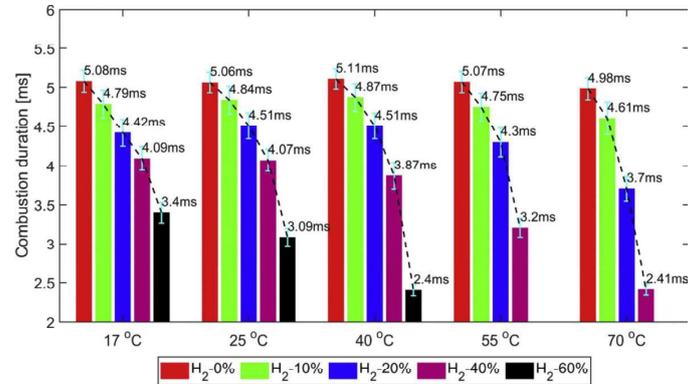

# Hydrogen

## Benefits:

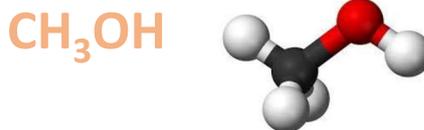

- Carbon-free e-fuel when integrated with renewable electricity
- Can be used either in ICE (addition to LNG, Otto or Diesel concept) or in fuel cells

## Challenges:

- Infrastructure
- Storage and volumetric energy density
- Difficult to control combustion (very high flame speed)
- Hydrogen embrittlement
- Injection system

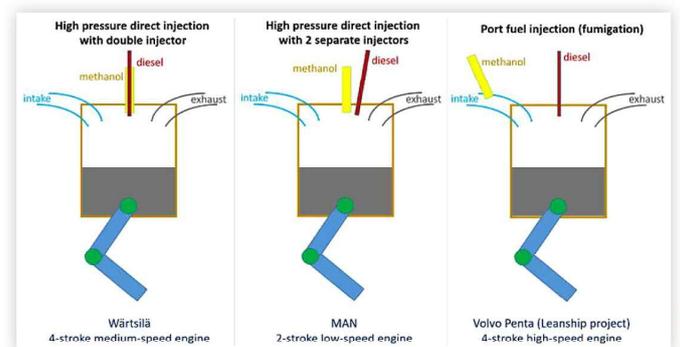

1. Figure: Cheng, Q., Ahmad, Z., Kaario, O., Vuorinen, V. and Larmi, M., 2021. Experimental study on tri-fuel combustion using premixed methane-hydrogen mixtures ignited by a diesel pilot. *International Journal of Hydrogen Energy*.  
 2. Verhelst, S. and Wallner, T., 2009. Hydrogen-fueled internal combustion engines. *Progress in energy and combustion science*, 35(6), pp.490-527.

# Methanol

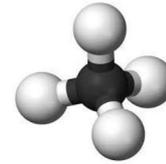

- Storage in atmospheric conditions (liquid)
- Biodegradable and miscible with water, far less toxic for aquatic life than HFO/MDO
- Need for dedicated engines or retrofitting
- Successfully demonstrated combustion concepts<sup>1</sup>
- Significant decrease in local emissions (no SO<sub>x</sub> and PM, lower NO<sub>x</sub>)

**FIGURE 10** Three methanol dual-fuel engine concepts successfully demonstrated in the marine market.

# Liquified e-methane

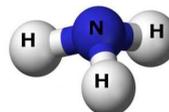

- Growing infrastructure for LNG compatible with LBG and liquified e-methane
- Commercial technology with available gas engines (dual-fuel, spark-gas)
- Emissions: no SO<sub>x</sub> and PM, lower NO<sub>x</sub>
- Methane slip issue (high GWP)

**FIGURE 9** Required fuel tank space for the same autonomy of the vessel in case of fossil diesel oil, methanol, LNG, and liquid hydrogen. Example of a cubic shape tank, where 'a' is an arbitrary unit of the cube's dimension, and for LNG and H<sub>2</sub> cylindrical tanks required plus additional insulation.

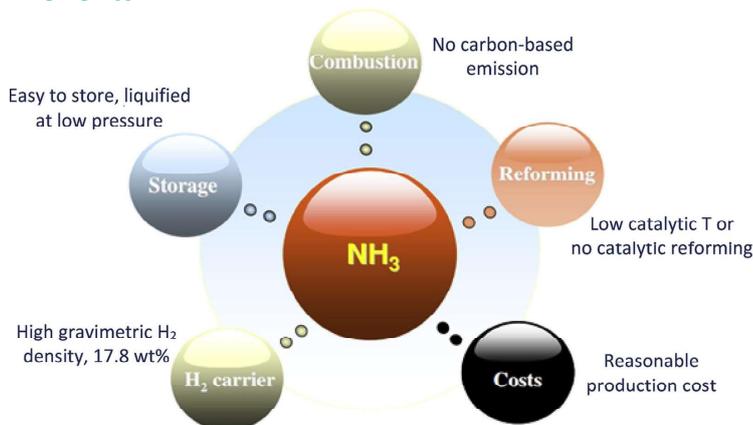

1. Figure: Santasalo-Aarnio, A., Nyari, J., Wojcieszek, M., Kaario, O., Kroyan, Y., Magdeldin, M., Larmi, M. and Järvinen, M., 2020. Application of Synthetic Renewable Methanol to Power the Future Propulsion (No. 2020-01-2151). SAE Technical Paper.

# Ammonia

## Benefits:

## Challenges:

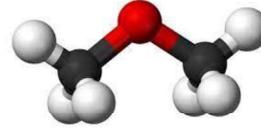

- Low vol. energy density
- Low viscosity
- Corrosive
- High autoignition temp.
- Low flame speed
- Toxicity & emissions

## Possibilities:

- Dual fuel combustion
- Hydrogen addition
- Other combustion concepts

# Dimethyl ether

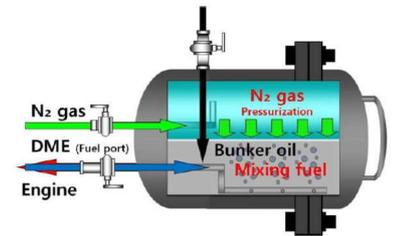

## Benefits:

- High cetane number
- Compatible with efficient diesel combustion
- Low PM emissions, low engine noise
- Non-toxic, evaporates from water and degrades in air
- Blending with HFO tested -> lower emissions<sup>2</sup>

## Challenges:

- Gaseous fuel, requires special engines and infrastructure
- Viscosity and lubricity are challenging (additives needed)
- Low energy content (larger fuel tanks)
- Rarely considered in the context of maritime (in past interest for HD trucks)

DME blending (20% & 40% wt.) with bunker oil improved performance<sup>2</sup>

<https://www.e-fuel.fi/>

# Objectives of e-fuel “Veturi”-project

1. Development of thermal integration of solid oxide electrolysis cell (SOEC) with downstream processes
2. Optimal connection of electrolyser with power grid to maximize profit and minimize carbon emissions
3. Development of catalytic partial oxidation (CPOX)/reverse water-gas shift (RWGS) concept integration and verification of long term operation (>1000 hrs)
4. Development of integrated concept of CO<sub>2</sub> capture, electrolysis and FT synthesis
5. Demonstration of integrated concept in bench scale (>1000 hrs)
6. Demonstration of drop-in paraffinic e-fuel production (up to 300 kg) and usability
7. Ensuring the environmental and other impacts of e-fuel production and produced paraffinic e-fuel
8. Generating e-fuel related technology IPR for exploitation and commercialization

**Main objective: demonstrate production of drop-in paraffinic e-fuels in bench scale with high efficiency by combining and integrating high temperature electrolysis and Fischer-Tropsch synthesis**

**Target after 2 years: 10kt/a**

# ICO2CHEM project

- Waste CO<sub>2</sub> streams from industry converted to FT products

## ICO2CHEM is the first Power-to-Liquid plant integrated into an industrial environment

News Published on 07 December 2020

The power-to-liquid plant has been installed at the Industrial Park Höchst in Frankfurt (Main) and was approved by GTÜ (approved inspection agency). It is now the world's first Power-to-Liquid plant integrated into an industrial environment. The operating campaign aiming to produce sustainable paraffinic waxes has just started and will last until the middle of 2021.

### InfraServ Höchst

Integration in the industrial infrastructure, supply of CO<sub>2</sub>, H<sub>2</sub> and further utilities

CO<sub>2</sub>: from Biogas upgrading plant H<sub>2</sub>: from Chlor-alkali electrolysis

Removing barriers to renewable transport fuels

**Prediction of fuel consumption and GHG emissions for alternative fuels in various modes of transportation.**

The research group of Energy Conversion from Aalto University is providing model validation with state-of-art knowledge and sophisticated, user-friendly tool with integral calculation, standards, user recommendations to accelerate the implementation of advanced biofuels into the market. The tool has been financed by the ADVANCE FUEL H2020 project (Grant Number 741910) under supervision of Aalto University.

The mission of ADVANCE FUEL project is to facilitate the commercialization of advanced renewable transport fuels to contribute to the achievement of the EU's renewable energy targets, and reduce carbon emissions in the transport sector by 2050 and beyond.

## Conclusions and take away

1. Large company driven and academic activities on PtX: hydrogen production, CO<sub>2</sub> sequestration, fuel synthesis
2. Large company driven and academic activities on XtP, especially for marine and off-road sectors: methanol, neat hydrogen, methane-hydrogen blends, ammonia

Thank You for your attention!

## Questions, answers, and comments

Q. Any experiences (robustness, tribology, oil interactions...)of methanol usage in shipments, ferry, or any else? Is it too early to apply?

A. We have been running the methanol engine in such way. We have experiences on the oil. My feeling is that we should have to use different kind of oil specification. Otherwise, I'm not very concerned about methanol usage. Methanol combustion is pretty doable. We are working on port-fuel methanol injection (not published).

C. Comment with the methanol combustion. Port-fuel injection or early direct injection, lots of communication with lubrication oil. Then fuel, lubrication oil interaction will be quite severe. Otherwise, interaction with lubrication oil will be much smaller.

## Questions, answers, and comments

Q. How is the robustness of direct Fischer-Tropsch (FT) compared with the conventional two-stage FT?

A. The robustness of the direct FT depends on the Fe catalyst, which has rather unstable characteristics. This needs to be overcome by adding secondary metals like Zn and Cu.

# Conclusions and Future Plans

## Conclusions

- Mobile Carbon Capture is **technically feasible** for road vehicles and marine vessels
- Different capture technologies have their own pros and cons
  - Solvent systems have the best potential
- Commercialization will depend on **future regulations and overcoming challenges**

## Future Plans

- Improve competitiveness
  - Cost
  - Compactness

## Questions, answers, and comments

Q. Can you give us the feeling for semi-trucks? How heavy do you assess the complete carbon storage system you have on the truck. Do you assess it to be 1 ton or less?

A. It's a good question. So, of course, it depends on how much fuel you have. CO<sub>2</sub> is about three times heavier than fuel. Because, you are adding 2 atoms of oxygen. In this case, you are capturing 40% of CO<sub>2</sub> from fuel, and the fuel tank is about 200 gallons of diesel. So, initially, when you have only fuel, the way to assess them without the CO<sub>2</sub>, it is about 1 ton. A bit over 1 ton. It is not optimized for weight. Because we wanted to do some research evaluation. As the vehicles goes, you are adding directly to CO<sub>2</sub>, but, losing the weight of fuel. So you are adding to the weight a little bit. 40% times 0.3 minus 1. This is roughly how much it will be.

Q. You mentioned the solvent system in its best potential to separate CO<sub>2</sub>. But, I think there are good membranes such as Zeolite that can withstand high temperature and pressures. It is also a good candidate. I would like to know your opinion.

A. I agree. There is no method that is perfect. There are pros and cons. Zeolite as solid solvent, they have some challenges. The watcher will reduce the CO<sub>2</sub> capacity a lot. So, you have to dry the whole exhaust gas. So, you need more equipment and energy. If we put Zeolite in membranes, you need driving force. So, you need to compress the exhaust gas or create vacuum on the other side of membrane. All these require mechanical energy. From our calculations, we have heat energy available already. Converting heat energy to mechanical energy, we lose efficiency. However, there is a challenge for low temperature. It is possible. I'm not saying it is not possible.

Q. I have a question about the phase of the stored CO<sub>2</sub>. Is it stored as liquid or compressed gas?

A. It is a supercritical fluid. If it is in cold temperature, it is typically in supercritical gas.
